# INTRODUCTION TO OPEN-END BELTS

Megadyne started manufacturing moulded transmission belts in 1957 and extruding open ended belts in 1975. Megalineer open length belts are manufactured in thermoplastic polyurethane, that gives superior wear and abrasion resistance. Various types of steel cord, offer good running characteristics, even under high tractive loads. Advanced production processes, allow the ability to engineer bespoke technical design solutions to meet market demands. By selecting from a range of components and materials, Megalineer belts can be manufactured to perform in even the most demanding applications. **MEGALINEAR** open-end belts are particularly suited where the most precise accuracy of position, low noise and long maintenance free cycles are the key requirements. Megadyne has expanded the Megalineer range to include:

- **MEGALINEAR QST**
- **MEGALINEAR GW**
- **MEGALINEAR FC**

Uniquely designed to reduce the noise levels, generated during high speed operations, **MEGALINEAR QST** is completely self-tracking without the need for flanged pulleys. The nylon faced helical offset teeth design, provides a high torque capacity.

For heavier applications, Megadyne have introduced the **MEGALINEAR GW**, a high performance thermoplastic polyurethane belt. Superior load capacities can be achieved due to the high shear strength of the tooth design, coupled with high tension, steel zinc coated cords, **MEGALINEAR GW** guarantees a greater transmittable power under continuous high loads.

**MEGALINEAR FC** is a new range of belts of the **MEGALINEAR** family. Specifically introduced for the food processing industry, **MEGALINEAR FC** is manufactured with food contact approved materials, according to European regulations EU 1935/2004, EU 10/2011 and EU 174/2015. Manufactured in T5/T10 pitch without nose gap between the teeth and available with a variety of backing profiles, for all kinds of conveying and processing applications. These advanced FDA synchronous belts, have excellent resistance to chemicals and corrosion, certified for wet and dry food contact. Their use is particularly prevalent in a variety of applications in food processing and packaging. The homogenous belt design ensures a significantly greater service life, with a high level of hygienic integrity.

# INTRODUCTION TO OPEN-END BELTS

Thanks to their features, Megalineer belts can be successfully used in a wide range of application such as:

- conveyors
- automatic sliding doors and garage opening system
- elevators
- automated handling devices
- linear drivers
- positioning system
- wood industry
- textile machine
- serigraphic industry
- glass industry
- stone and marble industry
- packaging industry
- robot systems
- tobacco industry
- paper and carton industry
- chemist and pharmaceutical industry

Megadyne has developed a very wide range of solutions with numerous tooth designs, tensile members and compound, suitable for all applications.

# CLASSIFICATIONS

## CLASSIFICATIONS

Megalinear Timing Belts are manufactured in thermoplastic polyurethane, with single parallel steel cords. This type of belts, developed by our Research & Development, offers good running characteristics and high traction loads. They are especially suited for power transmission and conveying with high loads and speeds. The addition of a nylon coating on the teeth during production enhances the running properties for specific applications and reduces the noise due to a lower frictional coefficient. An extra thickness of special coating is also possible on the back of the belt offering extra protection against aggressive or heavy products.

1. The body of the belts is white thermoplastic polyurethane 92 ShA, characterized by high levels of wear resistance even in the presence of shock and surge loading.
2. High strength S and Z parallel zinked steel tension members allow high breaking load and extremely low elongation. The combination of these high grade materials improves belt performances which can be summarised as follows:
  - exceptional resistance to abrasion and tooth shear
  - low coefficient of friction
  - high flexibility
  - ozone and temperature resistance (-25 °C / +80 °C)
  - oil, grease and gasoline resistance

## MECHANICAL AND CHEMICAL CHARACTERISTICS

- Constant dimensions
- Noiseless
- Free maintenance
- High flexibility
- High resistance steel traction cords, with little stretching and top flexibility
- Linear speeds up to 20 m/s
- Low pretension
- Constant length
- High abrasion resistance
- Ageing, Hydrolysis, Ozone resistant
- Working temperature -25 °C / +80 °C
- High resistance to Oils, Greases and Gasoline
- Fairly Acid-proof and Alkali-proof

### BODY

Megalinear belts are manufactured with white thermoplastic Polyurethane 92 ShA as standard. Special compounds (different hardnesses, special properties) are available on request. Special compound and cords have to be tested and homologated on the application. Megadyne is not responsible for wrong functioning of special products. Here under some PU characteristics:

<b>Water</b>	No problem in normal or sea clean water, at room temperature. Over 60 °C there is a fast decrement of breaking strength.
<b>Acids</b>	In acid diluted proportions, at room temperature, this PU is moderately attacked. In high concentration acid solutions, this PU has a very short lifespan. Over 50 °C, acids are always dangerous for Thermoplastic PU.
<b>Alkalis</b>	In alkalis diluted proportions, at room temperature, this PU is moderately attacked. In high concentration alkaline solutions, this PU has a very short lifespan. Over 50 °C, alkalis are always dangerous for Thermoplastic PU.
<b>Solvents</b>	Thermoplastic PU is insoluble in the greater part of solvents. Only the very polar solvents (same as tetrahydrofuran, dimethylformamide, n-methylpyrrolidone) can dissolve or tight damage PU. The Esters or the Ketons (same as ethyl acetate or methylethylketene) can usually produce a bulge, decreasing mechanical characteristics. The Hydrocarbons aromatic and the Hydrocarbons aliphatic produce very high bulge. All the effects increase by increasing temperature.
<b>Oils</b>	PU has a high resistance to mineral pure oils (lubrificants, engine oils, combustible oils). Usually, high performance syntetic oils, due to special additives contained, can be incompatible with Thermoplastic PU, especially at high temperature.

<b>Greases</b>	PU has a high resistance to mineral pure greases (lubricants greases). Usually, high performance syntetic greases, due to special additives contained, can be incompatible with Thermoplastic PU, especially at high temperature.
<b>Fuels</b>	Good resistance to petrols without Alcohols. In presence of Alcohols, Thermoplastic PU can suffer deterioration. Fuels including Aromatiche stuffs can produce reversible bulges.
<b>Microorganisms</b>	In presence of grime, containing humidity, Microorganisms can develop.
<b>Weather agents</b>	In case that Microbic attack can produce danger, you have to use a special kind of PU. Good resistance to atmospheric agents. White colour can change to light yellow under long UV exposure. In any case this hasn't influence on mechanical resistance.

## CORDS

<b>Standard cord</b>	Megalinear is manufactured with S and Z parallel zinked steel cords as standard.
<b>Kevlar</b>	Kevlar tension cords are suggested for: <ul style="list-style-type: none"> <li>• Non magnetic, for use in drives with metal detectors</li> <li>• Widely used in the food industry</li> <li>• Applications in damp evonronement must be avoided</li> </ul> Kevlar cord belts have a lower dimentional stabiliy compared to stell cord belts. Length and tollerance may change.
<b>HP</b>	High Performance cords have 25% more strength capacity than standard cords. They are recommended for high repeatability applications.
<b>HF</b>	High Flexibility cords can accept smaller pulley and idler diameters than standard cords. They are suitable for multi-shaft drives with severe reverse bending.
<b>HPF</b>	High Performance and Flexibility cords have 25% more strength capacity like the HP cords, but they are more flexible than the HP cords. They are suggested for high performance and multi-shaft drives.
<b>Stainless steel</b>	Stainless steel cords have 25% less strength capacity than standard cords. They are recommended for water applications.

## COATING

Megalinear can be manufactured with special coating on the teeth or on the back. Please check on page 118 and 119.

## IDENTIFICATION CODE

Using the information in the table below, it is possible to identify the correct belt for every application. The code is composed of letters and numbers as the following example::

1	2	3	4	5	6					
<b>J</b>	<b>+</b>	<b>50</b>	<b>+</b>	<b>AT</b>	<b>+</b>	<b>10</b>	<b>+</b>	<b>10000</b>	<b>+</b>	<b>SPECIAL MANUFACTURES</b>

- 1) **J** joined belt.
- 2) **ML** Megalinear belt open-end.
- 3) **50** this number indicates the width of requested belt. The value is in mm for a belt with a pitch in mm, and in inches for a belt with a pitch in inches.
- 4) **AT** this code composed by letters indicates the selection of profile.
- 5) **10** this number indicates the standard pitch of the belt. It is expressed in mm.
- 6) **10000** the last number indicates the length of the belt always in mm regardless of pitch.
- 6) **SPECIAL MANUFACTURES:**
  - special cords as Kevlar or HP or HF or HPF or stainless steel
  - special compound as different hardness 85 ShA or different colours (black - red - yellow - blue)
  - extra coating NFT or NFB or AVAFC or Tenax or Linatex or Honey comb or PU black cellulose or PU yellow or Neoprene rubber.

# TECHNICAL CALCULATION

## LINEAR MOTION BELT

## OMEGA LINEAR MOTION BELT

## CONVEYOR BELT

The following pages contain data, formulae and tables that are required to design a new belt drive. For critical and difficult drives, it is recommended that you contact our Application Department for advice.

Symbol	Unit	Definition	Symbol	Unit	Definition
<b>a</b>	m/s <sup>2</sup>	acceleration	<b>g</b>	m/s <sup>2</sup>	gravity (9,81)
<b>b</b>	mm	belt width	<b>μ</b>	–	friction coefficient
<b>C</b>	–	safety factor	<b>m</b>	Kg	conveyed mass
<b>Δl/100</b>	%	elongation	<b>M<sub>t</sub></b>	Nm	drive torque
<b>d</b>	mm	idler pitch diameters	<b>n<sub>1</sub></b>	1/min	revs/min (RPM) of drive sprocket 1
<b>d<sub>1</sub></b>	mm	sprocket pitch diameter	<b>P</b>	KW	drive power
<b>F<sub>p</sub></b>	N	pretension	<b>Q</b>	N	force exerted by mass (m)
<b>F<sub>u</sub></b>	N	peripheral force	<b>V</b>	m/s	belt speed
<b>F<sub>p spec</sub></b>	N/cm	transmittable force per tooth per unit width	<b>Z<sub>1</sub></b>		number of teeth of sprocket
<b>MTL</b>	N	max traction load	<b>Z<sub>m</sub></b>		number of teeth in mesh on driver sprocket (12)
<b>BS</b>	N	breaking strength	<b>Z<sub>L</sub></b>		number of teeth of large pulley
<b>c</b>	mm	centre distance	<b>Z<sub>s</sub></b>		number of teeth of small pulley
			<b>p</b>		belt pitch

Max traction load is maximum acceptable traction on cords.  
 Breaking strength is necessary load to break belt cords.  
 Elongation is belt elongation under load.

### USEFUL FORMULAE AND CONVERSION FACTORS

$$V = \frac{d_1 \cdot n_1}{19100} \quad n_1 = \frac{V \cdot 19100}{d_1} \quad d_1 = \frac{V \cdot 19100}{n_1} \quad Q = m \cdot g$$

$$P = \frac{M_t \cdot n_1}{9550} \quad M_t = \frac{9550 \cdot P}{n_1} \quad M_t = \frac{F_u \cdot d_1}{2000}$$

## CHOICE OF BELT PITCH AND SPROCKETS

For optimum belt pitch see tables on page 10.

For optimum choice of sprocket size, it is desirable to have as near to 12 teeth in mesh as possible.

Knowing mass	→ For horizontal & conveying drives	$F_u = (m \cdot a) + (m \cdot g \cdot \mu)$
	(Note: values of $\mu$ can be found in table 1 on page 11).	
	→ For vertical drives	$F_u = (m \cdot a) + (m \cdot g)$
Knowing drive torque		$F_u = 2000 M_t / d_1$
Knowing drive power		$F_u = 19.1 \cdot 10^6 \cdot P / (d_1 \cdot n_1)$

## BELT WIDTH AND PROFILE ESTIMATION

The belt width  $b$  should be calculated using the following formula

$$b = (F_u \cdot c_s \cdot 10) / (F_{p \text{ spec}} \cdot Z_m)$$

$C_s$  = safety factor from page 11 table 4  
 $F_u$  = from above calculation  
 $Z_m$  = number of teeth in mesh on driver sprocket  
 $Z_m = [0,5 - \frac{4 \cdot p}{79 \cdot c} (Z_L - Z_s)] \cdot Z_s$   
 = (if calculated  $Z_m > 12$  for an open-end application use  $Z_m = 12$ )  
 = (if calculated  $Z_m > 6$  for a joined application use  $Z_m = 6$ )  
 $F_{p \text{ spec}}$  = transmittable force per tooth per unit width (see table on belt data pages)

## PRE-TENSIONING

The suggested installation tension:

$F_p = 2 \cdot F_u$  for linear and omega linear movement applications  
 $F_p = F_u$  for conveyor applications

## CORD CHECK

The maximum allowable tensile load of the belt pitch/width combination selected (see tables on belt data pages):

$$\text{max traction load of choosen belt} > \frac{F_p}{2} + (F_u \cdot C_s)$$

## SPROCKET AND IDLER DIAMETER CHECK

Ensure that all selected pulley and idler diameters are equal to or greater than the minimum values specified in corresponding belt data page.

## ELONGATION

When the belt is operating there will be an elongation proportional to max traction load:

$$\Delta l / l_0 = (F_u \cdot 4) / \text{max traction load}$$

# LINEAR MOTION CALCULATION EXAMPLE (OPEN-END BELT)

## MACHINE DATA

$C = 2.000 \text{ mm}$   
 $d_1 = 76 \text{ mm}$   
 $n_1 = 300 \text{ RPM}$   
 $P = 1,8 \text{ KW}$   
 low fluctuating load

## CHOICE OF BELT PITCH AND SPROCKETS

According to the belt pitch selection table n.1 on page 10 considering the values of  $P$  and  $n_1$ , we select RPP8 belt. Then we consider the pulley diameter nearest to the requested value and the corresponding  $n$ . of teeth (see technical information on page 63). Therefore  $Z_1 = 30$  teeth (with a pitch diameter of 76,4 mm).

## CALCULATION OF THE EFFECTIVE TENSION

Since the drive power is known,  $F_u$  can be calculated

$$F_u = \frac{19,1 \cdot 10^6 \cdot P}{d_1 \cdot n_1} = \frac{19,1 \cdot 10^6 \cdot 1,8}{76,4 \cdot 300} = 1500 \text{ N}$$

## DETERMINATION OF THE BELT WIDTH

$$b = \frac{F_u \cdot C_s \cdot 10}{F_{p \text{ spec}} \cdot Z_m}$$

$$b = \frac{1500 \cdot 1,4 \cdot 10}{62 \cdot 12} = 28,2 \text{ mm}$$

$F_u$  = from before (1500 N)  
 $C_s$  = from page 11 table 4, for low fluctuating load  $C_s = 1,4$   
 $Z_m$  = given that driver pulley has 30 teeth and  $n$ . of teeth in mesh = 15 but max  $Z_m$  is 12, then  $Z_m = 12$   
 $n_1$  = 300 RPM (given)  
 $F_{p \text{ spec}}$  = 62N / cm (refer page 62 at 300 RPM)

Since the next closest width is 30 mm: 30 RPP8 is chosen.

## PRE-TENSIONING

$$F_p = 2 \cdot F_u \quad F_p = 3000 \text{ N}$$

## CORD CHECK

From page 62, RPP8 pitch 30 mm wide: max traction load 4750 N

$$\text{max traction load} > \frac{F_p}{2} + (F_u \cdot C_s) \quad \frac{F_p}{2} + (F_u \cdot C_s) = 1500 + 1500 \cdot 1,4$$

4750 N > 3600 N selected belt is acceptable.

## SPROCKET AND IDLER DIAMETER CHECK

Ensure that all selected pulley and idler diameters are greater than or equal the minimum values specified on page 63.

## ELONGATION

$$\Delta l_{/00} = \frac{F_u \cdot 4}{\text{max traction load}} = \frac{1500 \cdot 4}{4750} = 1,26 \text{ mm/m}$$

In the dynamic situations you will have an elongation of 1,26 mm per meter of operating belt.

# CONVEYOR BELT CALCULATION EXAMPLE (JOINED BELT)

## MACHINE DATA

$C = 5.000 \text{ mm}$   
 $d_1 = 100 \text{ mm}$   
 $V = 0,5 \text{ m/s}$   
 $a = 0,5 \text{ m/s}^2$   
 Guide in nylon  
 $Q = 4500 \text{ N}$   
 low fluctuating load

## CALCULATION OF THE EFFECTIVE TENSION

Since the mass is known,  $F_u$  can be calculated  $F_u = (m \cdot a) + (m \cdot g \cdot \mu)$  value of  $\mu$  according to table 3 on page 11 = 0,35  
 $F_u = (460 \cdot 0,5) + (460 \cdot 9,81 \cdot 0,35) = 1810 \text{ N}$   
 $m = Q/g = 4500 / 9,81 = 460 \text{ kg}$

## CHOICE OF BELT PITCH AND SPROCKETS

According to the belt selection table n. 2 on page 10, considering the values of  $F_u$  (for joined belts enter double of calculated  $F_u$  in table 2), we select T 10. Then we consider the pulley diameter nearest to the requested value and the corresponding n. of teeth (see technical information page 35). Therefore  $Z_1 = 32$  teeth (with a pitch diameter of 101,86 mm).

## DETERMINATION OF THE BELT WIDTH

$b = \frac{F_u \cdot C_s \cdot 10}{F_{p \text{ spec}} \cdot Z_m}$ $b = \frac{1810 \cdot 1,4 \cdot 10}{45 \cdot 6} = 93,85 \text{ mm}$	$F_u$ = from before (1810 N) $C_s$ = from page 11 table 4, for low fluctuating load $C_s = 1,4$ $Z_m$ = given that driver pulley has 32 teeth and n. of teeth in mesh = 16 but max $Z_m$ for joined belt is 6, hence, $Z_m = 6$ $n_1 = (Vp \cdot 60.000) / (\pi \cdot d_1) = (0,5 \cdot 60.000) / (\pi \cdot 101,86)$ as $d_1 = 101,86$ from before = 94 RPM $F_{p \text{ spec}} = 45 \text{ N / cm}$ (refer page 34, at 100 RPM)
---	---

Since the next closest width is 100 mm: 100 T10 is chosen.

## PRE-TENSIONING

$$F_p = F_u \text{ so } F_p = 1810 \text{ N}$$

## CORD CHECK

From page 34, T10 pitch 100 mm wide joined: max traction load 5415 N

$$\text{max traction load} > F_p + (F_u \cdot C_s) \quad F_p + (F_u \cdot C_s) = 1810 + (1810 \cdot 1,4)$$

5415 N > 4344 N selected belt is acceptable.

## SPROCKET AND IDLER DIAMETER CHECK

Checking technical data on page 35 for pulley and idlers, it can be seen that the drive has acceptable pulley diameters.

## ELONGATION

$$\Delta l / l_0 = \frac{F_u \cdot 4}{\text{max traction load}} = \frac{1810 \cdot 4}{5415} = 1,33 \text{ mm/m}$$

In the dynamic situations you will have an elongation of 1,33 mm per meter of operating belt.

# CALCULATION PARAMETERS

## BELT PITCH SELECTION

Table n. 1

## BELT WIDTH SELECTION

Table n. 2

Average values valid for standard steel cord. After belt selection, please check belt resistance on belt data page.

**Table n. 3 - Friction coefficient**

<b>Sliding friction on dry surface</b>	
Polyurethane / smooth steel	$\mu = 0,5$
Polyurethane / rough steel	$\mu = 0,7$
Polyurethane / abrasive steel	$\mu = 0,9$
Polyurethane NFT / smooth steel	$\mu = 0,25$
Polyurethane NFT / rough steel	$\mu = 0,35$
Polyurethane NFT / abrasive steel	$\mu = 0,6$
Polyurethane / nylon	$\mu = 0,35$
Polyurethane NFT / nylon	$\mu = 0,15$
Polyurethane / aluminium	$\mu = 0,8$
Polyurethane NFT / aluminium	$\mu = 0,45$

screw		1,8
<b>Brick machinery</b>		1,8

# BELT INSTALLATION

A major difficulty installing transmission belt is to achieve correct belt tension. Lifetime of support bearings and transmission belts and therefore reliability of the complete system largely depends on an optimally adjusted belt tension. Pretension is the force needed to put tension into the system to avoid the belt jumping on the pulleys as in the example below:

**Not correct belt installation**

For a correct system installation, all applications with Megalinear belt can be summarised according following two sketches:

## 1) Linear and omega linear motion belt

## 2) Conveyor belt

$F_p$  = pretension  
 $F_u$  = peripheral force (see calculation pag. 8/9)  
 $r$  = pulley radius

## PROCEDURE TO MEASURE

The procedure to measure the tension of the belt is to use a Belt Tension Gauging Equipment. This device consists of a small sensing head which is held across the belt to be measured. The belt is then tapped to induce the belt to vibrate at its natural frequency. The vibrations are detected and the frequency of vibration is then displayed on the measuring unit. The relation between belt static tension ( $T_s$ ) and frequency of vibration ( $f$ ) may be calculated using the following formula:

$$f = \frac{1}{2t} \cdot \sqrt{\frac{T_s}{m}} \quad \text{or} \quad T_s = 4 \cdot m \cdot t^2 \cdot f^2$$

Where :

$T_s$  = static tension (N)

$f$  = Frequency of vibration in Hertz (Hz)

$m$  = Belt mass per unit length (kg/m)

$t$  = Free belt span length in meters (m)

## BELT INSTALLATION

For a correct system functioning and to increase belt life, it is necessary a correct pulley installation: pulleys has to be parallel and aligned as shown in drawing 1 (correct configuration).

If pulleys are not parallel as in drawing 2, belt could fall during functioning and this can provoke damages to complete equipment.

To grant a correct belt running,  $\alpha$  and  $\Delta x$  must be as smaller as possible. For more information, please contact our technical staff.

In omega application to grant good mesh between pulley and teeth and to respect belt flexibility avoiding excessive stress on cords, distance  $d$  (as drawing 4) has to be:

**$d = 4 \cdot \text{belt width}$**   
**Suggested angle  $120^\circ$**

Moreover for a good drive work, it is suggested to check belt straightness as follows:

Belt width	Testing belt length	Maximum suggested bending (A)
Till to 20 mm	1 m	3 mm
Over 20 mm	2 m	4 mm

# FIXING PLATES

The fixing plates are used to fix the tail of the open belts.

On the customer's request, the plates can be delivered with or without fixing holes.

As the belt can't be stretched with the fixing plates we suggest to use other tension system.

The plates are delivered in aluminium alloy.

The Megadyne Technical Staff is ready to study special or particular applications.

# POSITIONING AND TRANSMISSION PRECISION

Backlash between belt and pulley teeth is very important for positioning and transmission synchronism.

To improve transmission precision, it is possible to use zero or reduced backlash pulleys. Please note that these pulleys don't reduce the elasticity of belt teeth or cords.

Maximum recommend pulley teeth is:

- Till 100 1/min    Z = 40
- Till 500 1/min    Z = 30
- Till 1000 1/min    Z = 20

In following table there is a list of average values for backlashes:

Available pitch for "zero" backlash pulley	T5 XL	T10 L H	T20 XH	AT5	AT10	AT20
Average backlash value for standard	0,6	1,2	2,4	0,2	0,4	0,8

RPP belts and pulleys offer great solution for positioning system because their parabolic profile reduces backlash and improves meshing quality.

# CLEATS

Megadyne timing belts can be customised with profiles vulcanised on the backside. All the cleats are made using the same thermoplastic polyurethane as the MEGALINEAR body (white PU 92 ShA).

The profiles are attached with the best technology now available, the High Vibration System.

The production process for these profiles is very flexible; Megadyne can design any profile to meet the specific requirement of the customer, in order to check and develop all the needed special profiles.

## STANDARD PARALLELEPIPED PROFILES

Megadyne can produce, as standard cleats, the parallelepiped profiles, starting from a thermoplastic polyurethane strip roll and cutting until the requested profile dimension.

The  $t$  value (thickness) is available from 2 until 13 mm, the  $h$  value (height) can be from 3 until 120 mm and the width can be 150 mm maximum.

Megadyne recommend that the profile spacing were multiple of the belt pitch; in any case, for special inquiries and small quantities, it is possible to weld the profiles also in others positions; the feasible dimensions, with the standard process tolerances, are introduced in the following sketch.

The tolerances on the position are +/- 0.5 mm.

The cumulative tolerance on the spacing of the profiles is the same of the length tolerance for our standard belts (+/- 0.8 mm/m) (tighter tolerances are available on request).

Due to the welding process, a bead of material develops at the meeting point of profile and belt.

In any case, Megadyne always remove this welding bead.

### Profile MECHANICAL RESISTANCE

In order to find the right cleat dimensions, please consider the following factors:

- Section base cleats resistance (**R**) becomes bigger, increasing:
  - cleats width (**w**)
  - cleats thickness (**t**)

- Cleat stiffness is bigger:
  - increasing cleat thickness (**t**)
  - using special moulded profiles, like STDE0006, STDE0008, STDE0010 and STMI0012 types

**MIN. N° OF PULLEY TEETH FOR BELTS WITH PROFILES**

The profiles presence can change the belt flexibility properties; the two factors that affect the original flexibility are the following:

- thickness of the cleat “foot“ (size of the base). Flexibility decreases when welded area dimensions increase
- position of the welded profile on the belt. When the cleats are welded in axis with the teeth, belt flexibility is better than when cleats are welded in axis with the little nose.

Please find, in the following table, flexibility properties for the cleated belts.

MINIMUM NUMBER OF PULLEY TEETH													
CLEATS OVER A TOOTH							CLEATS NOT OVER A TOOTH						
CLEATS THICKNESS	4	5	6	8	10	12	CLEATS THICKNESS	4	5	6	8	10	12
XL	18	18	25	40	50	100	XL	45	45	50	60	100	-

RPP5	18	18	25	40	50	100	RPP5	45	45	50	60	100	-
RPP8	14	14	14	18	25	45	RPP8	30	30	40	45	50	65
RPP14	18	18	18	18	18	20	RPP14	20	20	30	40	45	54

**STANDARD PARALLELEPIPED PROFILES WITH HOLES**

Parallelepiped profiles are available also with holes, to satisfy specials applications; please find below the standard tolerances for this kind of cleats.

For belt flexibility and mechanical resistance, please kindly refer to values for cleats without holes.

**MOULDED CLEATS**

Using an high performance injection system, Megadyne can produce any profile designed by the customer. For cleats not yet present in following pages, Megadyne can produce dedicated mould according customer requirements. For belt flexibility and mechanical resistance, please kindly refer to standard parallelepiped profiles section.

## COVER PROPERTIES

Megalinear belt can be coated with several materials. Those coatings are able to suit Megalinear belts to all applications. Main advantages for using coated belts are: reducing noise and modifying friction in conveying materials. Choice of correct coating depends on application field.

Megadyne is able to supply extruded coated belt, in this case coating method is same as belt production method and cohesion between belt and cover is guaranteed by welding without using glue.

Properties of extruded coating are followings:

	Cover type								
	NFB nylon fabric back	NFT nylon fabric teeth	AVAFC 60	AVAFC 70	AVAFC 85	Foamed polyurethane	APL	Fishbone	Ribbed
Raw material	nylon	nylon	polyurethane	polyurethane	polyurethane	foamed polyurethane	polyurethane/PVC	polyurethane	polyurethane

## SPECIAL EXECUTION FEASIBILITY

Megadyne can make special extrusion on customer request to improve belt properties and to suit better to special applications.

### SPECIAL POLYURETHANE

---

On customer request and with minimum quantity, Megalinear belt can be produced with different hardness:

- 85 ShA food quality polyurethane for contact with food and medical products
- 92 ShA higher resistance to temperature
- 92 ShA silicon free for painting system based on water
- 95 ShA glass reinforced
- 98 ShA extra hard polyurethane

### COLOUR

---

On customer request and with a minimum quantity is possible to produce megalinear with several colours.

Different colour doesn't influence belt technical properties so mechanical features are same as standard white belt.

Available colours are: • White • Black • Blue • Yellow • Transparent

### SPECIAL EXTRUSION

---

On customer request, Megadyne R&D department can develop special extruded belts by designing special mould.

It is also possible to extrude standard belt with special cords position, ready for successive reworkings.

### MECHANICAL REWORK

---

Megadyne have been producing specialized belting for many years. Our in-house facilities enable us to produce belt with special holes for vacuum conveyors, belts with special backings / ground finishes for high tolerance applications. We can remove individual teeth and perforate the timing belt as required.

### BACK GRINDING

---

A belt back can be ground to achieve a precise belt thickness as an adjunct to precision drives. When belt back grinding to a tolerance is required, the total thickness, including the tooth, must be specified. A grinding tolerance of  $\pm 0.2$  mm is achievable with a level finish (i.e. thickness will not vary greatly around the belt). Most widths and lengths are available.

### LONGITUDINAL REWORK

---

Longitudinal rework along the belt back is possible on covered and uncovered belts. The profile can be machined precisely for required function. The measurement is given as the depth on the belt back. Most widths and lengths are available.

### REWORK ON BELT TEETH

---

The rework of the tooth profile can be very useful, i.e. improving the steering effect with guide rails. The rework dimension is given from the top of the tooth. Most belt widths and lengths are available.

### HOLES IN TIMING BELTS

---

Holes in timing belts can be for vacuum or air film conveying or as clearance for assembly mechanisms. Stops and cams can be attached through the holes. Customized tooling may be required depending on the layout and dimensions of holes required.

### SINGLE TOOTH REMOVAL

---

Single and multiple tooth removal is available to your requirement, for applications in handling and conveying technology.

### CERTIFIED BELTS FOR DIRECT FOOD CONTACT (MEGALINEAR FCM)

---

On customer request and with minimum quantity, it is possible to produce Megalinear belts

approved and certified for direct contact with dry and wet food according to EC 10/2011 and EC 1934/2004 regulations, and limited to the following configuration:

- 92  $\pm$  4 ShA special grade polyurethane, sky blue colour (RAL 5012 reference)
- Stainless steel cord insert only
- NFT\NFB fabric and covers options NOT available
- Available profiles T5-T10-T20-AT5-AT10-AT20-H-STD8-ATG10

# ANTISTATIC POLYURETHANE TIMING BELTS

Megadyne now offers antistatic belts. Under certain conditions, a polyurethane belt may build-up a significant static electric charge. For applications where belts are intended for operation in a potentially explosive atmosphere or near electrical components, polyurethane belts should be sufficiently conductive to dissipate this electrical charge. Belts can be constructed (using proper nylon fabric coating) with a relatively low electrical resistance characteristic and are typically referred to as “static conductive” surface or “antistatic” surface. The test methods for determining the surface resistive properties of a belt are based on ISO 9563, “Belt Drives - Electrical Conductivity of Anti-static Endless Synchronous Belts - Characteristics and Test Method”. To be antistatic the electrical resistance, in ohms, of a belt measured in accordance with test method of norm ISO 9563, should not exceed:

$$\text{Resistance} = \Omega = \frac{(6 \cdot 10^5) \cdot L}{W}$$

where: L = is dry distance between electrodes (7 grooves, 6 teeth between contacts)  
W = is the width of the belt

L and W are expressed in the same units (mm or inches).

Megadyne antistatic belts are produced with black polyurethane as standard.

## TYPICAL APPLICATIONS

- Conveyance of PC boards or other electronic assemblies
- Semiconductor processing
- Conveying munitions of explosive detonators
- Paper conveying
- Power transmission applications in textile industries
- Chemical environment power transmission or conveying
- Clean room conveyors and power transmissions

## SPECIAL EXECUTION PHOTOS

### **Glass Industry**

Coating and special grinding on the back allow Megadyne belt to be suitable to all customer applications

### **Tobacco industry**

Belt with special cleats for tobacco industry

### **Nappy industry**

Wide extruded belt for nappy industry

### **Packaging industry**

Special reworking to install custom made elements

### **Automotive industry**

Belt suitable to convey steel coils and plates due to guides on the back

### **Paper industry**

Special extruded belt for vacuum conveyor application in paper industry

### Carton Industry

New extruded belt  
for vacuum application  
in carton conveyor industry

### Conveyor application

Special coating for conveyor application

### Automotive industry

Due to its antistatic properties,  
belt suitable for steel plate conveyor  
in car industry

### Lift industry

Patented belt  
designed on customer requirement  
for an innovative lift system

### Fish industry

High variety of cleats allow  
Megalinear belts to work  
in several fields
