TO SUPPORT YOU, WE DESIGN AND PRODUCE

An industrialized process with various levels
of customization

For over 45 years, Rollon has adopted an approach entailing responsibility and ethics in the design and production of our linear motion solutions for different industrial sectors. The reliability of an international technology group has now been combined with the availability of a local support and service network

VALUES

PERFORMANCE

Rollon's goal is to help our clients become more competitive in their markets through technological solutions, design simplification, productivity, reliability, duration, and low maintenance.

ROBOTICS

INDUSTRIAL MACHINERY

LOGISTICS

RAILWAY

COLLABORATION

High-level technical consulting and cross-competence allow us to identify the needs of our clients and transform them into guidelines for continuous exchange, while our strong specialization in the different industrial sectors becomes a factor in developing projects and innovative applications.

Rollon takes on the task of design and development of linear motion solutions, taking care of everything for our customers, so that they can concentrate on their core business. We offer everything from individual components to specifically designed, mechanically integrated systems: the quality of our applications is an expression of our technology and competence.

SOLUTIONS APPLICATIONS

INTERIORS AND ARCHITECTURE

MEDICAL

SPECIAL VEHICLES

AERONAUTICS

DIVERSIFIED LINEAR SOLUTIONS FOR EVERY APPLICATION REQUIREMENT

Linear and telescopic rails

Linear Line

Linear and curved rails with ball and roller bearings, with hardened raceways, high load capacity, self-alignment, and capable of working in dirty environments.

Telescopic Line

Telescopic rails with ball and roller bearings, with hardened raceways, high load capacities, low bending, resistant to shocks and vibrations. For partial, total or extended extraction up to 200% of the length of the guide.

Linear actuators and automation systems

Actuator Line

Linear actuators with different rail configurations and transmissions, available with belt, screw, or rack and pinion drives for different needs in terms of precision and speed. Rails with bearings or ball recycle systems for different load capacities and critical environments.

Actuator System Line

Integrated actuators for industrial automation, used in applications in several industrial sectors: automated industrial machinery, precision assembly lines, packaging lines and high speed production lines. The Actuator Line evolves to satisfy the requests of our most discerning clients.

Compact Rail

New Compact Rail

It simplifies the project, improves the performance and reduces the application cost: **8 main advantages.**

1

Self-aligning system

- Select the most suitable structure for your project
- Avoid machining the mounting surface
- Reduce the assembly time

Up to 3.9 mm with T+U or K+U rails
Up to 3.5 mm with TG rails

Compact Rail

Configurations of

Rails with different geometries

Single row ball bearings

Up to $\pm 2^\circ$ with K+U rails

Up to $\pm 2^\circ$ with K+U rails

Up to 3.9 mm with T+U or K+U rails

Rail with convex raceways and higher rigidity

Double row ball bearings

* Example referred to size 43.

Up to $\pm 1.3^\circ$ with RP+RA or RU+RA sliders

Up to $\pm 1.3^\circ$ with RP+RA or RU+RA sliders

Up to 3.5 mm with RP+RV or RU+RV sliders

**2**

Optimal reliability in dirty environments

Lateral sealing for a greater protection against contaminants

New self-centering wiper for an optimal cleansing of the raceways

**3**

Resistant to corrosion

Different surface treatments make Compact Rail reliable even in the harsher environments

- **Indoor applications:** zinc-plating ISO 2081. Also available with electro-painted black finishing
- **Corrosive environments (humidity):** ZincNickel-plating ISO 19598.
- **Corrosive environments (acidic or basic):** nichel-plating

**4**

Long lifetime

Induction hardened raceways with 1.2 mm effective depth and hardness between 58 and 62 HRC

**5**

High dynamics

Speed up to 9 m/s
Acceleration up to 20 m/s²

New Compact Rail slider

Improved performance and a new look designed to fit every project perfectly.

**6**

Low maintenance

Integrated lubrication system with slow release felt and front-access for greasing

**7**

Uniquely quiet

Ground raceways for a smooth and silent movement

**8**

Strength and sturdiness

Thanks to steel slider body

ROLLON®

Compact Rail

Product explanation

> The newly designed Rollon guide with double row ball bearings for higher load capacities.

Fig. 1

Featuring double row ball bearings, new rigid rails with convex raceways and new robust steel sliders with longitudinal protection and floating wipers, Compact Rail Plus has been designed for the most demanding applications in terms of load capacities, dynamics and work environment. All while maintaining the self-aligning capabilities that make this product family unique.

The rails are made of cold drawn carbon steel, zinc-plated for sizes 28 and 43 and hardened with Rollon-Nox patented process for size 18 (nitriding and black oxidation). Other treatments for higher corrosion resistance are available as an option. For sizes 28 and 43, raceways are induction hardened and ground. The sliders are available in four versions: guiding slider; floating slider; extra-floating slider and rotating slider. Combining two rails with different sliders makes it possible to create self-aligning systems that can compensate misalignment errors on two planes: radial up to $\pm 1.3^\circ$ and axial up to 3.5 mm.

The most important characteristics:

- High radial and axial load capacity
- High rigidity
- Robust steel slider with longitudinal protection and floating wipers
- Self-aligning in two planes
- Induction hardened and ground raceways (size 28 and 43)
- Nitriding and black oxidation and polished raceways (size 18)
- Protected for dirty environments
- High operating speeds
- Wide temperature range
- Two ways to adjust the slider in the guide rail
- Different anticorrosion treatments available for rails and slider bodies

Preferred areas of application:

- Cutting machines
- Medical technology
- Packaging machines
- Photographic lighting equipment
- Construction and machine technology (doors, protective covers)
- Robots and manipulators
- Automation
- Handling

Rail with convex raceways

Rails are made of cold-drawn carbon steel and feature a c-shaped cross-section with interior convex raceways. The rail shape allows protection from accidental bumps and other damages that might occur during usage.

For sizes 28 and 43, the raceways are induction hardened and fine ground and the rail is zinc-plated. Other treatments are available for higher corrosion resistance, these include: Rollon Aloy, Rollon E-coating and nickel plating. For size 18, the rail is treated with Rollon-Nox nitriding and oxidation process that provides a fine black color to the entire rail. Other anticorrosion treatments are not available.

Fig. 2

Fig. 3

R-slider

Robust zinc plated steel slider with sealed double row ball bearing rollers, self-centering heads with wipers, longitudinal seals to protect the internal components and a top sealing strip to prevent accidental tampering of the fixed rollers. The slider body is accurately finished with matte longitudinal edge chamfer and a shining ground flat surface. It is available for all sizes, configurable with up to six rollers depending on the load requirement. Four versions are available to allow different floating capacities and create self-aligning systems: RV guiding slider, RP floating slider, RU extra-floating slider and RA rotating slider.

Fig. 4

RD-slider

Constructed as the R-slider with mounting holes parallel to the direction of preferred loading. It is available for sizes 28 and 43, with three or five rollers, depending on load case and load direction set with the corresponding configuration.

Fig. 5

Self-alignment system: V+P/U

The combination of two rails, one featuring a RV guiding slider and one featuring a RP floating slider or RU extra-floating slider, creates a system that allows to compensate large axial misalignment errors.

Fig. 6

Self-alignment system: A+P/U

The combination of two rails, one featuring a RA rotating slider and one featuring a RP floating slider or RU extra-floating slider, creates a system that allows to compensate misalignment errors on two planes: axial and radial.

Fig. 7

Rollers

The precision rollers have double row ball bearings to provide high load capacities in both radial and axial direction. All rollers are equipped with splash-proof plastic seal (2RS). They are available in three versions: guiding rollers with two contact points on the raceway; floating rollers with one contact point and two lateral shoulders to limit the axial floating; extra-floating rollers with completely flat outer ring for total excursion. All rollers can also be ordered individually, and for size 28 and 43 it is available the stainless steel version.

Fig. 8

Wipers

The slider heads are equipped with special slow release felt pads and are free to rotate with respect to the slider body, so that the felts are always in contact with the raceways to ensure a perfect lubrication. The felts can be grased through a dedicated oil refilling access on the front of the head, simply by means of a syringe oiler.

Fig. 9

Alignment fixture

The alignment fixture is used during installation of joined rails in order to precisely align the rails with each other.

Fig. 10

Technical data

Fig. 11

Performance characteristics:

- Available rail sizes: 18, 28, 43
- Max. operating speed: 7 m/s (276 in/s) (depending on application)
- Max. acceleration: 15m/s² (590.55 in/s²) (depending on application)
- Max. radial load capacity: 10,800 N (per slider)
- Temperature range: -20 °C to +120 °C (-4 °F to +248 °F)
briefly up to max. +150 °C (+302 °F)
- Available rail lengths from 160 mm to 3,600 mm (6.3 in to 142 in)
in 80-mm increments (3.15 in), longer single rails up to max.
4,080 mm (160.6 in) on request for sizes 28 and 43.
- Rollers material: steel 100Cr6 (also available stainless steel AISI 440)
- Roller pins lubricated for life
- Roller seal/shield: 2RS (splash-proof)
- In sizes 28 and 43 rails and slider bodies are standard zinc-plated
according to ISO 2081, raceways are induction hardened and ground.
- In size 18 rails are hardened with Rollon-Nox treatment of deep nitri-
ding and black oxidation and slider bodies are standard zinc-plated
according to ISO 2081.
- Rail material of rails size 28-43: cold-drawn carbon steel CF53
- Rail material of rails size 18: cold-drawn carbon steel 20MnCr5

Notes:

- The sliders are equipped with rollers that are in alternating contact
with both sides of the raceway. Markings on the body around the roller
pins indicate correct arrangement of the rollers to the external load
- With a simple adjustment of the eccentric rollers, the desired clearance
or preload on the rail and slider can be set (see pg. CR-35)
- Rails in joined design are available for longer transverse distances
(see pg. CR-43).
- Screws of property class 10.9 must be used
- When mounting the rails, it is crucial to ensure that the mounting holes
in the structure are properly chamfered (see pg. CR-34 tab. 59)
- The general illustrations show R-sliders as an example
- For rollers size 28 and 43 it is available the stainless steel version
(see pg. CR-18).

> Configurations and behavior of the slider under yawing moment M_z

Individual slider under M_z moment load

When an overhanging load in an application with a single slider per rail causes an M_z moment in one direction, a 4 to 6 roller Compact Rail slider is available. These sliders are available in both configuration A and B in regards to the roller arrangement to counter the acting M_z moment load. The moment capacity of these sliders in the M_z -direction varies significantly through spacing L_1 and L_2 in accordance with the direction of rotation of M_z .

Especially in the use of two parallel rails, it is extremely important to pay attention to the correct combination of the slider configuration A and B, in order to use the maximum load capacities of the slider.

The diagrams below illustrate this concept of the A and B configuration for sliders with 4 and 6 rollers. The maximum allowable M_z -moment is identical in both directions for all 3 and 5 roller sliders.

Fig. 12

Fig. 13

Two sliders under M_z moment load

When an overhanging load acts on an application with two sliders per rail and causes an M_z -moment in one direction, different support reactions occur on the two sliders. For this reason, an optimal arrangement of slider configurations must be achieved to reach the maximum load capacities. In practice, when using R-sliders with 3 or 5 rollers, the two sliders must be installed rotated by 180° so that the slider is always loaded on the side with the highest number of rollers.

For an even number of rollers this has no effect. The RD-sliders with installation option from above or below cannot be installed due to the position of the rollers in reference to the installation side, therefore they are available in the configurations A and B (see fig. 15).

Fig. 14

RD-slider under load moment M_z 

Configuration not possible for sliders RDA.

Fig. 15

Slider configurations for various load cases

Arrangement DS

This is the recommended arrangement for use of two sliders under M_z -moment when using one rail. Also see previous page: Two sliders under M_z moment load.

Fig. 16

Arrangement DD

When using a pair of guide rails with two sliders each under M_z moment load, the second system should be designed in arrangement DD. This results in the following combination: one guide rail with two sliders in arrangement DS and the other guide rail with 2 sliders in arrangement DD. This allows even load and moment distribution between the two parallel rails.

Fig. 17

Arrangement DA

Standard arrangement if no other information is given. This arrangement is recommended if the load point is located within the two outside points of the sliders.

Fig. 18

> Load capacities

Fig. 19

The load capacities in the following table apply for one slider.

The functional characteristic is related to the nominal floating capacity, for more information see pg. CR-22, CR-23.

Technical Instructions

✓

> Linear accuracy

Linear accuracy is defined as the maximum deviation of the slider in the rail based on the side and support surface during straight line movement.

The linear accuracy, depicted in the graphs below, applies to rails that are carefully installed with all the provided screws on a level and rigid foundation.

Fig. 33

ΔS [mm]	0.05

Tab. 15

> Points of contact between rollers and raceways

Guiding rollers (Version V)

The guiding rollers have two contact points with the raceways. This creates a well constrained movement of rollers on the raceway, in both radial and axial direction.

Fig. 34

Floating rollers (Version P)

The floating rollers engage only the peak of the raceway. They are constrained radially but allowed to float in the axial direction between the two shoulders. The rollers can also rotate a little.

Fig. 35

Extra-floating rollers (Version U)

The extra-floating rollers engage only the peak of the raceway. They are constrained radially but allowed to float in the axial direction without limitation. The completely flat surface of the rollers allows an axial travel wider than the floating rollers, and they can also rotate a little.

(Note: being free from lateral shoulders, extra-floating rollers could run out of the rail or against the bottom rail when exceeding the nominal floating capacity)

Fig. 36

> Sliders composition

Guiding sliders (RV -slider)

Guiding sliders are built only with guiding rollers. For this reason, they are completely constrained and can support loads and moments in all directions, especially the radial ones.

Fig. 37

Floating sliders (RP -slider)

Floating sliders are built only with floating rollers. They are able to slightly travel axially and to rotate a bit without affecting the preload or the smooth running quality.

Fig. 38

Extra-floating sliders (RU -slider)

Extra-floating sliders are built only with extra-floating rollers. They are able to fully travel axially and to rotate a bit without affecting the preload or the smooth running quality. (Note: being free from lateral shoulders, extra-floating sliders could run out of the rail or against the bottom rail when exceeding the nominal floating capacity).

Fig. 39

Rotating sliders (RA -slider)

Rotating sliders are built mixing guiding and floating rollers. They are able to carry full radial load and retain the ability to guide the payload as it travels, while also rotating a bit without affecting the preload or the smooth running quality. Rotating sliders are used to absorb angular errors in the mounting surfaces.

Fig. 40

> V+P/U-system tolerance compensation

Axial deviations in parallelism

This problem occurs fundamentally by insufficient precision in the axial parallelism of the mounting surfaces, which results in an excessive load on the slider and thus causes drastically reduced service life.

The combination of two rails, one featuring a RV-slider and one featuring a RP-slider or RU-slider, creates a system that allows to compensate large axial misalignment errors. The limit is set by the axial misalignment permitted by the RP- or RU-slider.

Fig. 41

Fig. 42

Maximum offset

RP-sliders feature floating rollers that are able to slightly travel axially between the two shoulders, while RU-sliders feature extra-floating rollers that are able to fully travel axially without constraints. The maximum axial offset that can be compensated is made up of the combined values S_1 and S_2 listed in table 16. Considered from a nominal value B_{nom} as the starting point, S_1 indicates the maximum offset into the rail, while S_2 represents the maximum offset towards the outside of the rail.

Slider type	S_1 [mm]	S_2 [mm]	B_{min} [mm]	B_{nom} [mm]	B_{max} [mm]
RPG18	0.4	0.4	16.1	16.5	16.9
RP28G RDP28G	0.4	0.4	23.6	24	24.4
RP43G RDP43G	1	1	36	37	38
RUG18	0.4	1	16.1	16.5	17.5
RU28G RDU28G	0.4	2	23.6	24	26
RU43G RDU43G	1	2.5	36	37	39.5

Tab. 16

The application example in the adjacent drawing (see fig. 44) shows that the V+P/U-system implements a problem-free function of the slider even with an angled offset in the mounting surfaces.

If the length of the guide rails is known, the maximum allowable angle deviation of the screwed surfaces can be determined using this formula (the floating slider moves here from the innermost position S_1 to outermost position S_2):

$$\alpha = \arctan \frac{S^*}{L}$$

$$S^* = \text{Sum of } S_1 \text{ and } S_2$$

$$L = \text{Length of rail}$$

Fig. 43

The following table (tab. 17) contains guidelines for this maximum angle deviation α , achievable with the longest guide rail from one piece.

Size	Rail length [mm]	Offset S [mm]	Angle α [°]
RPG18	2960	0.8	0.015
RP28G	3200	0.8	0.014
RP43G	3600	2	0.031
RUG18	2000	1.4	0.040
RU28G	3200	2.4	0.043
RU43G	3600	3.5	0.055

Tab. 17

The V+P/U-system can be designed in different arrangements (see fig. 45). A TG-rail with RV-slider accepts the vertical components of load A TG-rail with RP-slider or RU-slider slider attached underneath the component to be guided prevents the vertical panel from swinging and is used as moment support. In addition, a vertical offset in the structure, as well as possible existing unevenness of the support surface, is compensated.

Fig. 44

Fig. 45

> **A+P/U-system tolerance compensation**

Deviations in parallelism in two planes

The A+P/U-system, like the V+P/U, can compensate for axial deviations in parallelism. The RP- or RU-slider allows to correct the longitudinal parallelism error and, additionally, the RA-slider can rotate in the rail, to compensate for other deviations in parallelism, e.g. height offset.

RA-sliders are built mixing guiding and floating rollers. They carry the full radial load and retain the ability to guide the payload as it travels, while being able to rotate in the rail without affecting the preload or the smooth running quality. The combination of two rails, one featuring a RA-slider and one featuring a RP- or RU-slider, can be used to absorb both axial and angular errors in the mounting surfaces.

Fig. 46

The maximum allowable rotation angle of the RA-sliders are shown in the following table 18 and figure 47. α_1 is the maximum rotation angle counterclockwise, α_2 is clockwise.

Slider type	α_1 [°]	α_2 [°]
RAG18	1	1
RA28G RDA28G	0.85	0.85
RA43G RDA43G	1.3	1.3

Tab. 18

Fig. 47

Fig. 48

Maximum offset

It must be noted that the RP- or RU-slider in one rail will turn during the movement and rotation of the RA-slider in the other to allow an axial offset. During the combined effect of these movements, you must not exceed the maximum values (see tab. 19). B_{0nom} is a recommended nominal starting value for the position of a RP- or RU-slider when part of a tolerance compensation system.

Slider type	B_{0nom} [mm]	Angle α [°]
RPG18	16.5	1°
RP28G RDP28G	24	1.7°
RP43G RDP43G	37	2.6°
RUG18	16.5	1°
RU28G RDU28G	24	1.7°
RU43G RDU43G	37	2.6°

Tab. 19

If a RA-slider is used in combination with a RP- or RU-slider with guaranteed problem-free running and without extreme slider load, a pronounced height difference between the two rails can also be compensated. The following illustration shows the maximum height offset b of the mounting surfaces in relation to the distance a of the rails (see fig. 49).

Fig. 49

Even the A+P/U-system can be used in different arrangements. If the same example as with the V+P/U-system is observed (see pg. CR-25, fig. 45), this solution, in addition to the prevention of vibrations and moments, also enables the compensation of larger deviations in parallelism in the vertical direction, without negative consequences to the guide. This is particularly important for longer strokes as it is more difficult to obtain a correct vertical parallelism.

Fig. 50

> Preload

Preload classes

The factory installed systems, consisting of rails and sliders, are available in two preload classes:

Standard preload K1 means a rail-slider combination with minimum preload which means the rollers are adjusted free of clearance for optimal running properties.

Usually preload K2 is used for rail-slider systems for increasing the rigidity. When using a system with K2 preload a reduction of the loading capacities and service life must be taken into consideration (see tab. 20).

Preload class	Reduction y
K1	-
K2	0.1

Tab. 20

This coefficient y is used in the calculation formula for checking the static load and lifetime (see pg. CR-95, fig. 172 and pg. CR 99, fig. 189).

The interference is the difference between the contact lines of the rollers and the raceways of the rail.

Preload class	Interference* [mm]	Rail size
K1	0.01	all
K2	0.03	18
	0.04	28
	0.06	43

* Measured on the largest interior dimension between the raceways

Tab. 21

> Drive force

Frictional resistance

The drive force required for moving the slider is determined by the combined resistance of the rollers, wipers and seals.

The ground raceways and rollers have a minimal coefficient of friction, which remains almost the same in both the static and dynamic state. The wiper and longitudinal seals are designed for an optimum protection of the system, without a significant negative influence on the quality of motion. The overall friction of the Compact Rail also depends on external factors such as lubrication, preload and additional forces. Table 22 below contains the coefficients of friction for each slider type.

Fig. 51

Size	μ Roller friction	μ_w Wiper friction	μ_s Friction of longitudinal seals
18	0.003	$\frac{\ln(m \cdot 1000)^*}{0.98 \cdot m \cdot 1000}$	0.0015
28	0.003	$\frac{\ln(m \cdot 1000)^*}{0.06 \cdot m \cdot 1000}$	$\frac{\ln(m \cdot 1000)^*}{0.15 \cdot m \cdot 1000}$
43	0.005		

* Kilograms must be used for load m

Tab. 22

The values given in Table 22 apply to external loads, which, with sliders with three rollers, are at least 10 % of the maximum load rating. For calculating the driving force for lower loads, please contact Rollon technical support.

Calculation of drive force

The minimum required drive force for the slider is determined with the coefficients of friction (see tab. 22) and the following formula (see fig. 52):

$F = (\mu + \mu_w + \mu_s) \cdot m \cdot g$	$m = \text{mass (kg)}$ $g = 9.81 \text{ m/s}^2$
---	--

Fig. 52

Example calculation:

If a R...43G slider is used with a radial load of 100 kg, the result is $\mu = 0.005$; from the formula the following is calculated:

$$\mu_s = \frac{\ln(100000)}{0.15 \cdot 100000} = 0.00076$$

$$\mu_w = \frac{\ln(100000)}{0.06 \cdot 100000} = 0.0019$$

Fig. 53

This is the minimum drive force for this example:

$$F = (0.005 + 0.0019 + 0.00076) \cdot 100 \cdot 9.81 = 7.51 \text{ N}$$

Fig. 54

Fig. 55

> Lubrication

Roller pin lubrication

The bearings inside the rollers are lubricated for life. To reach the calculated service life (see pg. CR-107), a film of lubricant should always be present between the raceway and roller, this also serves to protect against corrosion of the ground raceways.

Lubrication of the raceways

Proper lubrication during normal conditions:

- reduces friction
- reduces wear
- reduces the load of the contact surfaces through elastic deformations
- reduces running noise

> Slider lubrication

The sliders are equipped with wiper heads that include lubricated felts which slowly release oil on the raceways for a long time. The felts inside the wiper heads can be refilled with lubrication by means of an oiling syringe with needle of OD 1.85mm (max) through the lubrication hole of the wiper located on the front side.

Fig. 56

The durability of the lubrication delivered by the wiper heads depends on the conditions of use. In the normal clean indoor applications, it is suggested to refill the oil every 0.5 million of cycles, 1000 km or 1 year of use whichever comes first. In different conditions, it could be necessary to refill more often, depending on the level of environment criticality. In case of severe dust and dirt conditions, it is suggested to change the entire wiper head with a new one.

When refilling the oil or the substituting the wiper heads, it is recommended to clean the raceways of the guide.

Lubricant	Thickening agent	Temperature range [°C]	Kinematic viscosity 40°C [mm²/s]
Mineral oil	Lithium soap	-20... to +120	approx 110

Tab. 23

> Corrosion protection

All rails and slider bodies have a standard corrosion protection system by means of electrolytic-zinc plating according to ISO 2081, except for size 18 rails where the standard treatment is Rollon-Nox hardening. If increased corrosion protection is required, application-specific surface treatments are available upon request for rails and slider bodies sizes 28

and 43, e.g. approved nickel plated for use in the food industry. In this case, the chosen treatment must be specified in the order for both rails and sliders using the appropriate code shown in the table below. For more information contact Rollon technical support.

Treatment	Characteristics
Rollon-Nox	Patented high depth nitride hardening and black oxidation treatment that provides good durability under high loads or frequencies and good corrosion resistance. It is standard for rails size 18 and it's not available for other sizes.
Zinc Plating ISO 2081	Standard treatment for rails sizes 28-43 and all slider bodies, it is ideal for indoor applications. When applied to the rail, it is removed from the raceways by the subsequent grinding process. Zinc-plated sliders are supplied with steel rollers. Not available for size 18.
ZincNickel ISO19598 (Z)	Ideal for outdoor applications. Sliders ordered with ZincNickel treatment are supplied with stainless steel rollers to further increase the corrosion resistance. Not available for size 18.
Rollon E-coating (K)	As zinc-plated version with additional electro painting that provides a fine black finishing to the entire rail. When applied to the rail, the slider can partially remove the coating from the raceways on the running contact point after a period of use. Sliders ordered with Rollon E-Coating are supplied with stainless steel rollers to further increase the corrosion resistance.
Nickel Plating (N)	Provides high resistance to chemical corrosion and is ideal for applications in medical or food related environments. When applied to the rail, raceways are coated too. Sliders ordered with Nickel Plating treatment are supplied with stainless steel rollers to further increase the corrosion resistance. Not available for size 18.

Tab. 24

> Speed and acceleration

The Compact Rail product family is suitable for high operating speeds and accelerations.

Size	Speed [m/s]	Acceleration [m/s ²]
18	3	10
28	5	15
43	7	15

Tab. 25

> Operating temperatures

The temperature range for continuous operation is: -20 °C / +120 °C with occasional peaks up to +150 °C.

Installation instructions

> Fixing holes

V-holes with 90° bevels

The selection of rails with 90° countersunk holes is based on the precise alignment of the threaded holes for installation. Here the complex alignment of the rail to an external reference is omitted, since the rail aligns during installation by the self-centering of the countersunk screws on the existing hole pattern.

Fig. 57

C-holes with cylindrical counterbore

When a rail with counterbored holes is delivered, the Torx® screws are provided in the right quantity. The cylindrical screw has, as shown, some play in the countersunk fixing hole, so that an optimum alignment of the rail can be achieved during installation (see fig. 58).

The area T is the diameter of the possible offset, in which the screw center point can move during the precise alignment.

Fig. 58

Rail type	Area T [mm]
TMGC18	Ø 1.0
TGC28	Ø 1.0
TGC43	Ø 2.0

Tab. 26

Chamfers

Chamfers must be realized for both C-holes and V-holes rails. The minimum chamfers on the fixing threads are listed on the table below.

Size	Chamfer C-holes [mm]	Chamfer V-holes [mm]
18	0.5 x 45°	0.5 x 45°
28	0.6 x 45°	1 x 45°
43	1 x 45°	1 x 45°

Tab. 27

Example for fixing with Torx® screws (custom design)

Example for fixing with countersunk screws

Fig. 59

> Adjusting the sliders

If requested in the order, rails and sliders are delivered as a system with factory adjustment. If rails and sliders are supplied separately or if the slider is to be mounted in another rail, the bearings will need to be adjusted. For sections 28 and 43, the preload can be calibrated using one of the following procedures. For section 18, the only suitable approach is to use the hexagonal spanner.

Common preliminary operations:

- (1) Check that the raceways are clean and remove the wipers, to increase sensitivity for proper preload.
- (2) Place the slider in the rail. It may be necessary to align the bearings to be adjusted with those fixed, to facilitate insertion. Excessive offset may make insertion difficult. Use a flat or hexagonal spanner.
- (3) Use a medium threadlocking adhesive in the screws.
- (4) Lightly tighten the upper bearing screw without over-tightening. Vice versa if the screw has already been previously tightened, loosen the bearing fixing screws slightly. The bearing must be able to rotate but should not be completely free. Only adjust the eccentric bearings (without the center marked).

With flat spanner

- (5) Position the slider at one end of the rail to simplify insertion of the flat spanner.
- (6) Insert the flat spanner supplied to the side, between the rail and the slider. Take care to insert it from the end of the slider, sliding it under the side seal until it reaches the bearing (Fig. 60). Use the flat spanner to engage the hexagon of the eccentric bearing.
- (7) Turn the flat adjustment spanner clockwise so that the eccentric bearing contacts the raceway opposite the factory-set fixed bearings, thus reducing the slider clearance to zero. Avoid applying a high preload, which would cause high wear and reduce service life.
- (8) While holding the rolling pin in the correct position with the flat adjustment spanner, tighten the fixing screw to ensure that the pin is first locked in position.
- (9) Run the slider and check the preload over the entire length of the rail. The movement must be smooth. If any oscillation/clearance or excessive force is observed, repeat the adjustment operation. Preload is optimized when the slider runs smoothly and without play.
- (10) For sliders with more than 3 bearings, repeat this procedure for each one to be adjusted. Ensure that all bearings have uniform contact with the raceways.
- (11) While maintaining the angular position of the pin with the flat spanner, tighten the adjusted bearing fixing screw with a torque spanner. The prescribed tightening torque is shown in table 28.
- (12) Reinstall the wipers.

Fig. 60

Slider type	Tightening torque [Nm]
R...18G	3
R...28G	9
R...43G	22

Tab. 28

With hexagonal spanner

- (5) Lock the rail on a stable support so that your hands are free.
- (6) Insert the hexagonal spanner into the pin, passing it through a hole in the track. Turn the hexagonal key slightly so that the eccentric bearing contacts the raceway opposite the factory-set fixed bearings, thus reducing the slider clearance to zero. When turning, support the upper screw by turning in the same direction with the second hexagonal spanner to prevent loosening or changes in preload settings.
- (7) While firmly holding the hexagonal spanner inserted in the off-center pin with one hand, use the other hexagonal spanner to turn and tighten the upper sealing screw of the bearing. Do not lock or unlock the off-center bearing by rotating the pin. Always turn the top screw to lock or loosen the bearing.
- (8) Slide the slider and check the preload over the entire length of the rail. The movement must be smooth. If any oscillation/clearance or excessive force is observed, repeat the adjustment operation. Preload is optimized when the slider runs smoothly and without play.
- (9) Preload values can be checked by slowly inserting the slider at the end of the rail. The insertion force is proportional to the preload. Normally a good setting corresponds to the following min/max forces shown in table 29.
- (10) For sliders with more than 3 bearings, repeat this procedure for each one to be adjusted. Ensure that all bearings have uniform contact with the raceways.
- (11) Tighten the rolling pin/screw definitively precisely using a torque spanner to ensure the correct tightening torque, in accordance with the values in table 28, while holding the hexagonal spanner to the pin, to avoid variations in the preload parameters. Always turn the top screw to lock or loosen the bearing.
- (12) Reinstall the wipers.

Fig. 61

Tab. 29

> Use of radial ball bearing rollers

Fig. 62

If purchasing "Radial ball bearing rollers" to install on your own structure (see p. CR-18) we advise:

- Using a maximum of 2 concentric radial ball bearing rollers
- Offset the seats of the concentric radial ball bearing rollers with respect to those of the eccentric radial ball bearing rollers according to the table 30.

Slider size	X [mm]	Ø A [mm]	B min. [mm]	Radius R [mm]
18	0.30	-	-	-
28	0.44	8 + 0.05/+0.02	2	0.5
43	0.90	11 + 0.05/+0.02	3	0.5

Tab. 30

Fig. 63

> Installing the single rail

The rails can be installed in two positions relative to the external force. For axial loading of the slider (fig. 64 pos. 2), the load capacity is reduced because of the decline in contact area caused by the change in position. Therefore, the rails should be installed in such a way that the load on the rollers acts in the radial direction (fig. 64, pos. 1). The number of fixing holes in the rail in combination with screws of property class 10.9 is dimensioned in accordance with the load capacity values. For critical applications with vibrations or higher demand for rigidity, a support of the rail (fig. 64, pos. 3) is advantageous.

This reduces deformation of the sides and the load on the screws. The installation of a rail with counterbored holes requires an external reference for alignment. This reference can also be used simultaneously as rail support if required. All information in this section on alignment of the rails, refers to rails with counterbored holes. Rails with countersunk holes self-align using the specified fixing hole pattern (see pg. CR-34, fig. 57).

Fig. 64

Rail installation with reference surface as support

- (1) Remove unevenness, burrs and dirt from the support surface.
- (2) Press the rail against the support surface and insert all screws without tightening them.
- (3) Start tightening the fixing screws to the specified torque on one end of the rail while continuing to hold pressure on the rail against the support surface.

Screw type	Torx® tightening torque [Nm]	Countersunk tightening torque [Nm]
M4 (TMG...18)	3	3
M5 (TG...28)	9	6
M8 (TG...43)	22	25

Tab. 31

Fig. 65

Fig. 66

Rail installation without support

(1) Carefully lay the guide rail with installed slider on the mounting surface and slightly tighten the fixing screws so that the guide rail lightly touches the mounting surface.

Fig. 67

(2) Install a dial indicator so that the offset of the rail to a reference line can be measured. Now position the slider in the center of the rail and set the dial indicator to zero. Move the slider back and forth between each two hole spacings and carefully align the rail. Fasten the three center screws of this area now with the specified tightening torque, see fig. 68.

(3) Now position the slider on one end of the rail and carefully align the rail to zero on the dial indicator.

Fig. 68

(4) Begin to tighten the screws as specified while moving the slider together with the dial indicator. Make sure that it does not show any significant deflection. Repeat this procedure from the other end of the rail.

Fig. 69

> Parallel installation of two rails

When two rails with guiding sliders RV, a V+P system or a V+U system are installed the height difference of the two rails must not exceed a certain value (obtainable from the table below) in order to ensure proper guiding. These maximum values result from the maximum allowable twisting angle of the rollers in the raceways (see tab. 32). These values account for a load capacity reduction of 30% on the rail and must absolutely be maintained in every case.

Size	α
18	1 mrad (0.057°)
28	2.5 mrad (0.143°)
43	3 mrad (0.171°)

Tab. 32

When using two rails, the maximum parallelism deviation must not be exceeded (see tab. 33). Otherwise stresses can occur, which can result in a reduction in load capacity and service life.

Rail size	K1	K2
18	0.03	0.02
28	0.04	0.03
43	0.05	0.04

Tab. 33

Note: For parallelism problems, it is recommended to use a V+P/U or A+P/U system, since these combinations compensate for inaccuracies (see pg. CR-24, or CR-26).

Fig. 70

Fig. 71

Parallel installation of two rails

(1) Clean chips and dirt from the prepared mounting surfaces and fasten the first rail as described in the section on installation of a single rail.

(2) Fasten the second rail on the ends and the center. Tighten the screws in Position A and measure the distance between the raceways of the two rails.

Fig. 72

(3) Fasten the rail in Position B so that the distance between the raceways does not exceed the measured values in Position A while maintaining the tolerances (see pg. CR-30, tab. 22) for parallel rail installation.

Fig. 73

(4) Fasten the screw in Position C so that the distance of the raceways is as close to an average between the two values from A and B as possible.

(5) Fasten all other screws and check the specified tightening torque of all fixing screws (see pg. CR-38, tab. 31).

Fig. 74

> Installation of the self-aligning systems

When using a two-track parallel linear guide we recommend the use of a misalignment compensation system: the combination of a V+P/U sliders to compensate for deviations in parallelism or A+P/U sliders to compensate for deviations in parallelism in two planes.

Installation steps

(1) For a compensating system, the rail with the guiding slider RV is always installed first. This is then used as a reference for the compensating bearing rail.

Then proceed as described in the section on installation of a single rail (see pg. CR-37).

(2) Install the other bearing rail and only tighten the fixing screws slightly.

(3) Insert the sliders in the rails and install the element to be moved, without tightening its screws.

(4) Insert the element in the center of the rails and tighten it, use screws class 10.9.

(5) Tighten the center rail fixing screws to the specified torque (see pg.CR-38, tab. 31).

(6) Move the element to one end of the rail and start tightening the rest of the screws in the direction away from the slider.

Fig. 75

Fig. 76

Fig. 77

> Joined Rails

If long guide rails are required, two or more rails can be joined to the desired length. When putting guide rails together, be sure that the register marks shown in fig. 78 are positioned correctly.

For applications with parallel joined guide rails we suggest them to be fabricated asymmetric.

Fig. 78

General information

The maximum available rail length in one piece is indicated in table 5 on page CR-11. Longer lengths are achieved by joining two or more rails (joined rails).

Rollon then machines the rail ends at a right angle to the impact surfaces and marks them. Additional fixing screws are included with the delivery, which ensure a problem-free transition of the slider over the joints, if the following installation procedures are followed. Two additional threaded holes (see fig. 79) are required in the load-bearing structure. The included end fixing screws correspond to the installation screws for the rails for cylindrical counterbores (see pg. CR-34).

The alignment fixture for aligning the rail joint can be ordered using the designation given in the table (see pg. CR-19, tab. 11).

Fig. 79

Rail type	A [mm]	Threaded hole (load-bearing structure)	Screw type	L [mm]	Alignment fixture
TMGC18 - TMGV18	7	M4	see pg. CR-19	8	ATMG18
TGC28 - TGV28	8	M5		10	ATG28
TGC43 - TGV43	11	M8		16	ATG43

Tab. 34

> Installation of joined rails

After the fixing holes for the rails are made in the load-bearing structure, the joined rails can be installed according to the following procedure:

- (1) Fix the individual rails on the mounting surface by tightening all screws except for each last one on the rail joint.
- (2) Install the end fixing screws without tightening them (see fig. 80).

Fig. 80

- (3) Place the alignment fixture on the rail joint and tighten both set screws uniformly, until the raceways are aligned (see fig. 81).
- (4) After the previous step (3) it must be checked if both rail backs lie evenly on the mounting surface. If a gap has formed there, this must be shimmed.

Fig. 81

- (5) The bottom of the rails should be supported in the area of the transition. Here a possible existing gap must be looked for, which must be closed for correct support of the rail ends by shims.

Fig. 82

- (6) Insert the key through the holes in the alignment fixture and tighten the screws on the rail ends.
- (7) For rails with 90° countersunk holes, tighten the remaining screws starting from the rail joint in the direction of the rail center. For rails with cylindrical counter-sunk holes, first adjust the rail to an external reference, then proceed as described above.
- (8) Remove the alignment fixture from the rail.

Fig. 83

Ordering key

Note on ordering: rails length codes are always 5 digits, sliders length codes are always 3 digits. Use zeroes as a prefix when lengths are shorter.

Compact Rail

Product explanation

> Self-aligning linear guides with bearings and C-profile featuring newly designed robust steel slider

Fig. 84

Compact Rail is the product family of guide rails consisting of roller sliders with radial bearings which slide on the internal, induction hardened and ground raceways of a C-profile made from cold-drawn roller bearing carbon steel.

Compact Rail consists of three product series: the fixed bearing rail, the compensating bearing rail and the floating bearing rail. They can be combined to create self-aligning systems to compensate misalignment errors on two planes: axially up to 3.9 mm and radially up to 2°. All products are available in zinc plating, with other treatments for higher corrosion resistance as an option. There are five different sizes of guide rails and many different versions and lengths of the slide bearings, depending on the size and load requirement.

The most important characteristics:

- Compact size
- Corrosion resistant surface
- Not sensitive to dirt due to internal raceways and large rollers
- Hardened and ground raceways
- Self-aligning in two planes
- Quieter than recirculating ball systems
- High operating speeds
- Wide temperature range
- Easy adjustment of slider in the guide rail
- Different anticorrosion treatments available for rails and slider bodies

Preferred areas of application:

- Cutting machines
- Medical equipment
- Packaging machines
- Photographic lighting equipment
- Construction and machine technology (doors, protective covers)
- Robots and manipulators
- Automation
- Handling
- Special vehicles

Fixed bearing rails (T-rails)

Fixed bearing rails are used as the main load bearing of radial and axial forces.

Fig. 85

Floating bearing rails (U-rails)

The floating bearing rails are used for load bearing of radial forces and, in combination with the fixed bearing T-rail or compensation K-rail, as a support bearing for occurring moment loads.

Fig. 86

Compensation bearing rails (K-rails)

The compensation bearing rails are used for the load bearing of radial and axial forces. Tolerance compensation in two planes can be implemented in combination with the U-rail.

Fig. 87

Self-aligning system: T+U

The combination of fixed bearing rail and floating bearing rail allows for deviations in parallelism.

Fig. 88

Self-aligning system: K+U

The combination of compensation rail and floating bearing rail allows for deviations in parallelism and height offset.

Fig. 89

NSW/NSA-slider

Robust zinc plated steel slider with roller bearings, self-centering heads with wipers, longitudinal seals to protect the internal components and a top sealing strip to prevent accidental tampering of the fixed rollers. The slider body is accurately finished with matte longitudinal edge chamfer and a shining ground flat surface. It is available for all sizes, configurable with up to six rollers depending on the load requirement.

Fig. 90

CS-slider

Constructed with zinc-plated steel body and sturdy wipers (optional) made of thermoplastic elastomer. Available for all sizes. Depending on the load requirement, slider is configurable with up to six rollers.

Fig. 91

NSD/NSDA-slider

Constructed as the NSW/NSA-slider with mounting holes parallel to the direction of preferred loading. It is available for sizes 28 and 43, with three or five rollers, depending on load case and load direction set with the corresponding configuration.

Fig. 92

Rollers

Also available individually in all sizes. Available as eccentric or concentric rollers. Optionally available with splash-proof plastic seal (2RS) or with steel cover disc (2Z; 2ZR for size 63).

Fig. 93

Wipers

The slider heads are equipped with special slow release felt pads and are free to rotate with respect to the slider body, so that the felts are always in contact with the raceways to ensure a perfect lubrication. The felts can be grased through a dedicated oil refilling access on the front of the head, simply by means of a syringe oiler.

Fig. 94

Alignment fixture

The alignment fixture AT / AK is used during installation of joined rails in order to precisely align the rails with each other.

Fig. 95

Technical data

Fig. 96

Performance characteristics:

- Available sizes for T-rail, U-rail: 18, 28, 35, 43, 63
- Available sizes for K-rail: 43, 63
- Max. operating speed: 9 m/s (354 in/s)
(depending on application)
- Max. acceleration: 20 m/s² (787 in/s²)
(depending on application)
- Max. radial load capacity: 15,000 N (per slider)
- Temperature range: -20 °C to +120 °C (-4 °F to +248 °F)
briefly up to max. +150 °C (+302 °F)
- Available rail lengths from 160 mm to 3,600 mm (6.3 in to 142 in)
in 80-mm increments (3.15 in), longer single rails up to max. 4,080
mm (160.6 in) on request
- Roller pins lubricated for life
- Roller seal/shield: standard 2Z (steel cover disk), 2RS (splash-proof)
- Rollers material: steel 100Cr6 (also available stainless steel AISI 440)
- Rail raceways are induction hardened and ground
- Rails and slider bodies are standard zinc-plated according to
ISO 2081
- Rail material of T- and U-rails in sizes 18: cold-drawn roller bearing
carbon steel C43 F
- Rail material of K-rails, as well as T- and U-rails in size 28 to 63:
Cf53

Notes:

- The sliders are equipped with rollers that are in alternating contact
with both sides of the raceway. Markings on the body around the roller
pins indicate correct arrangement of the rollers to the external load
- With a simple adjustment of the eccentric rollers, the desired clear-
ance or preload on the rail and slider can be set.
- Rails in joined design are available for longer transverse distances
(see pg. CR-98)
- The K rails are not suitable for vertical installation
- Screws of property class 10.9 must be used
- Differences in screw sizes must be observed
- When mounting the rails, it is crucial to ensure that the mounting
holes in the structure are properly chamfered. (see pg. CR-91, tab. 74)
- The general illustrations show NSW-sliders as an example
- Rollers are available also in stainless steel version (see pg. CR-74).

> Configurations and behavior of the slider under yawing moment M_z

Individual slider under M_z moment load

When an overhanging load in an application with a single slider per rail causes an M_z moment in one direction, a 4 to 6 roller Compact Rail slider is available. These sliders are available in both configuration A and B in regards to the roller arrangement to counter the acting M_z moment load. The moment capacity of these sliders in the M_z -direction varies significantly through spacing L_1 and L_2 in accordance with the direction of rotation of M_z . Especially in the use of two parallel rails, for example with a T+U-system,

it is extremely important to pay attention to the correct combination of the slider configuration A and B, in order to use the maximum load capacities of the slider.

The diagrams below illustrate this concept of the A and B configuration for sliders with 4 and 6 rollers. The maximum allowable M_z -moment is identical in both directions for all 3 and 5 roller sliders.

Fig. 97

Fig. 98

Two sliders under M_z moment load

When an overhanging load acts on an application with two sliders per rail and causes an M_z -moment in one direction, different support reactions occur on the two sliders. For this reason, an optimal arrangement of slider configurations must be achieved to reach the maximum load capacities. In practice, when using NSW-sliders with 3 or 5 rollers, the two sliders must be installed rotated by 180° so that the slider is always loaded on the side with the highest number of rollers (with

NSA sliders this is not possible due to different rail geometries).

For an even number of rollers this has no effect. The NSD-sliders with installation option from above or below cannot be installed due to the position of the rollers in reference to the installation side, therefore they are available in the configurations A and B (see fig. 100).

Fig. 99

NSD-slider under load moment M_z 

Fig. 100

Slider configurations for various load cases

Arrangement DS

This is the recommended arrangement for use of two sliders under M_z -moment when using one rail. Also see previous page: Two sliders under M_z moment load.

Fig. 101

Arrangement DD

When using a pair of guide rails with two sliders each under M_z moment load, the second system should be designed in arrangement DD. This results in the following combination: one guide rail with two sliders in arrangement DS and the other guide rail with 2 sliders in arrangement DD. This allows even load and moment distribution between the two parallel rails.

Fig. 102

Arrangement DA

Standard arrangement if no other information is given. This arrangement is recommended if the load point is located within the two outside points of the sliders.

Fig. 103

> Load capacities

Slider

Fig. 104

The load capacities in the following tables each apply for one slider.

When using the slider in U-rails (floating bearing rails) the values are

$C_{0ax} = 0$, $M_x = 0$ and $M_y = 0$. When using the sliders in K-rails (compensation rails) the value is: $M_x = 0$.

> Manual clamp elements

Compact Rail guides can be secured with manual clamping elements. Areas of application are:

- Table cross beams and sliding beds
- Width adjustment, stops
- Positioning of optical equipment and measuring tables

The HK series is a manually activated clamping element. By using the freely adjustable clamping lever (except for HK 18, which uses hexagon socket bolt M6 DIN 913 with 3 mm drive) press the contact profile synchronously on the free surfaces of the rail. The floating mounted contact profiles guarantee symmetrical introduction of force on the guide rail.

Technical instructions

> Linear accuracy

Linear accuracy is defined as the maximum deviation of the slider in the rail based on the side and support surface during straight line movement.

The linear accuracy, depicted in the graphs below, applies to rails that are carefully installed with all the provided screws on a level and rigid foundation.

— TL...-UL...-

Tab. 60

> T+U-system tolerance compensation

Axial deviations in parallelism

This problem occurs fundamentally by insufficient precision in the axial parallelism of the mounting surfaces, which results in an excessive load on the slider and thus causes drastically reduced service life.

The use of fixed bearing and compensating bearing rail (T+U-system) solves the unique problem of aligning two track, parallel guide systems. By using a T+U-system, the T-rail takes over the motion of the track while the U-rail serves as a support bearing and takes only radial forces and M_z moments.

Fig. 133

Fig. 134

T+U-system maximum offset

U-rails have flat parallel raceways that allow free lateral movement of the sliders. The maximum axial offset that can be compensated for in each slider of the U-rail is made up of the combined values S_1 and S_2 listed in table 61. Considered from a nominal value B_{nom} as the starting point, S_1 indicates the maximum offset into the rail, while S_2 represents the maximum offset towards the outside of the rail.

Slider type	S_1 [mm]	S_2 [mm]	B_{min} [mm]	B_{nom} [mm]	B_{max} [mm]
NSW18	0.3	1.1	16.2	16.5	17.6
NSW28 NSD28	0.6	1.3	23.3	23.9	25.2
NSW35 NSD35	1.3	2.7	28.9	30.2	32.9
NSW43 NSD43	1.4	2.5	35.6	37	39.5
NSW63	0.4	3.5	50.1	50.5	54
CS18	0.3	1.1	14.7	15	16.1
CS28	0.6	1.3	23.3	23.9	25.2
CS35	1.3	2.7	28.9	30.2	32.9
CS43	1.4	2.5	35.6	37	39.5
CS63	0.4	3.5	49.4	49.8	53.3

Tab. 61

The application example in the adjacent drawing (see fig. 136) shows that the T+U-system implements a problem-free function of the slider even with an angled offset in the mounting surfaces.

If the length of the guide rails is known, the maximum allowable angle deviation of the screwed surfaces can be determined using this formula (the slider in the U-rail moves here from the innermost position S_1 to outermost position S_2):

$\alpha = \arctan \frac{S^*}{L}$	$S^* = \text{Sum of } S_1 \text{ and } S_2$ $L = \text{Length of rail}$
----------------------------------	--

Fig. 135

The following table (tab. 62) contains guidelines for this maximum angle deviation α , achievable with the longest guide rail from one piece.

Size	Rail length [mm]	Offset S [mm]	Angle α [°]
18	2000	1.4	0.040
28	3200	1.9	0.034
35	3600	4	0.063
43	3600	3.9	0.062
63	3600	3.9	0.062

Tab. 62

The T+U-system can be designed in different arrangements (see fig. 137). A T-rail accepts the vertical components of load A U-rail attached underneath the component to be guided prevents the vertical panel from swinging and is used as moment support. In addition, a vertical offset in the structure, as well as possible existing unevenness of the support surface, is compensated.

Fig. 136

Fig. 137

> **K+U-system tolerance compensation**

Deviations in parallelism in two planes

The K+U-system, like the T+U-system, can compensate for axial deviations in parallelism. Additionally, the K+U system has the option of rotating the slider in the rail, which will compensate for other deviations in parallelism, e.g. height offset.

The unique raceway contour of the K-rail allows the slider a certain rotation around its longitudinal axis, with the same linear precision as with a T-rail. With the use of a K+U-system, the K-rail accounts for the main loads and the motion of the track. The U-rail is used as a support bearing and takes only radial forces and M_z moments. The K-rail must always be installed so that the radial load of the slider is always supported by at least 2 load bearing roller sliders, which lie on the V-shaped raceway (reference line) of the rail.

Fig. 138

K-rails and sliders are available in both sizes 43 and 63. The custom NSA-slider may only be used in K-rails and cannot be exchanged with other Rollon sliders. The maximum allowable rotation angle of the NSA- and NSW-sliders are shown in the following table 63 and figure 139. α_1 is the maximum rotation angle counterclockwise, α_2 is clockwise.

Slider type	α_1 [°]	α_2 [°]
NSA43 and NSW43 / CSK43 and CSW43	2	2
NSA63 and NSW63 / CSK63 and CSW63	1	1

Values referred to NSW and CSW slider in U rail

Tab. 63

Fig. 139

K+U-system maximum offset

It must be noted that the slider in the U-rail will turn during the movement and rotation of the slider in the K-rail to allow an axial offset. During the combined effect of these movements, you must not exceed the maximum values (see tab. 64). If a maximum rotated NSW or CSW- slider is observed (2° for size 43 and 1° for size 63), the maximum and minimum position of the slider in the U rail results from the values B_{0max} and B_{0min} , which are already considered by the additional rotation caused axial offset. B_{0nom} is a recommended nominal starting value for the position of a NSW or CSW-slider in the U-rail of a K+U-system.

Fig. 140

Slider type	B_{0min} [mm]	B_{0nom} [mm]	B_{0max} [mm]
NSW43	37.6	38.85	40.1
NSD43	37.9	39.15	40.4
NSW63	49.85	51.80	53.75
CS43	37.6	38.85	40.1
CS63	49.85	51.80	53.75

Tab. 64

If a K-rail is used in combination with a U-rail, with guaranteed problem-free running and without extreme slider load, a pronounced height difference between the two rails can also be compensated for. The following illustration shows the maximum height offset b of the mounting surfaces in relation to the distance a of the rails (see fig. 141).

Fig. 141

Even the K+U-system can be used in different arrangements. If the same example as with the T+U-system is observed (see pg. CR-81, fig. 137), this solution, in addition to the prevention of vibrations and moments, also enables the compensation of larger deviations in parallelism in the vertical direction, without negative consequences to the guide. This is particularly important for longer strokes as it is more difficult to obtain a correct vertical parallelism.

Fig. 142

> Preload

Preload classes

The factory installed systems, consisting of rails and sliders, are available in two preload classes:

Standard preload K1 means a rail-slider combination with minimum preload which means the rollers are adjusted free of clearance for optimal running properties.

Usually preload K2 is used for rail-slider systems for increasing the rigidity. When using a system with K2 preload a reduction of the loading capacities and service life must be taken into consideration (see tab. 65).

Preload class	Reduction y
K1	-
K2	0.1

Tab. 65

This coefficient y is used in the calculation formula for checking the static load and lifetime (see pg. CR-103, fig. 179 and pg. CR 107, fig. 196).

The interference is the difference between the contact lines of the rollers and the raceways of the rail.

Preload class	Interference* [mm]	Rail type
K1	0.01	all
K2	0.03	T, U...18
	0.04	T, U...28
	0.05	T, U...35
	0.06	T, U, K...43, T, U, K...63

* Measured on the largest interior dimension between the raceways

Tab. 66

External preload

The unique design of the Compact Rail product family enables applying a partial external preload on selected locations along the entire guide.

An external preload can be applied by pressure along the side surfaces of the guide rail according to the drawing below (see fig. 143). This local preload results in higher rigidity only at the locations where it is necessary (e.g. on reversing points with high dynamic auxiliary forces).

This partial preload increases the service life of the linear guide by

avoiding a continually increased preload over the entire length of the guide. Also the required drive force of the linear carriage in the non-preloaded areas is reduced.

The amount of the externally applied preload is determined using two dial indicators by measuring the deformation of the rail sides. These are deformed by thrust blocks with pressure screws. The external preload must be applied when the slider is not directly located in the pressure zone.

Tab. 67

Fig. 143

The graph below indicates the value of the equivalent load as a function of the total deformation of both rail sides. The data relates to sliders with three rollers (see fig. 144).

Fig. 144

> Drive force

Frictional resistance

The drive force required for moving the slider is determined by the combined resistance of the rollers, wipers and seals.

The ground raceways and rollers have a minimal coefficient of friction, which remains almost the same in both the static and dynamic state. The wiper and longitudinal seals are designed for an optimum protection of the system, without a significant negative influence on the quality of motion. The overall friction of the Compact Rail also depends on external factors such as lubrication, preload and additional forces. Table 68 below contains the coefficients of friction for each slider type.

Fig. 145

Size	μ Roller friction	μ_w Wiper friction	μ_s Friction of longitudinal seals
18	0.003	$\frac{\ln(m \cdot 1000)^*}{0.98 \cdot m \cdot 1000}$	0.0015

* Kilograms must be used for load m

Tab. 68

The values given in table 68 apply to external loads, which, with sliders with three rollers, are at least 10 % of the maximum load rating. For calculating the driving force for lower loads, please contact Rollon technical support.

Calculation of drive force

The minimum required drive force for the slider is determined with the coefficients of friction (see tab. 68) and the following formula (see fig. 146):

$$F = (\mu + \mu_w + \mu_s) \cdot m \cdot g$$

$$m = \text{mass (kg)}$$

$$g = 9.81 \text{ m/s}^2$$

Fig. 146

Example calculation:

If a NSW43 slider is used with a radial load of 100 kg, the result is $\mu = 0.005$; from the formula the following is calculated:

$$\mu_s = \frac{\ln(100000)}{0.15 \cdot 100000} = 0.00076$$

$$\mu_w = \frac{\ln(100000)}{0.06 \cdot 100000} = 0.0019$$

Fig. 147

This is the minimum drive force for this example:

$$F = (0.005 + 0.0019 + 0.00076) \cdot 100 \cdot 9.81 = 7.51 \text{ N}$$

Fig. 148

Fig. 149

> Lubrication

Roller pin lubrication

The bearings inside the rollers are lubricated for life. To reach the calculated service life (see pg. CR-107), a film of lubricant should always be

present between the raceway and roller, this also serves to protect against corrosion of the ground raceways.

Lubrication of the raceways

Proper lubrication during normal conditions:

- reduces friction
- reduces wear
- reduces the load of the contact surfaces through elastic deformations
- reduces running noise

> NSW-slider lubrication

The NSW sliders are equipped with wiper heads that include lubricated felts which slowly release oil on the raceways for a long time. The wiper heads can be recharged from the front through a dedicated access hole by means of an oiling syringe.

Fig. 150

The durability of the lubrication delivered by the wiper heads depends on the conditions of use. In the normal clean indoor applications, it is suggested to refill the oil every 0.5 million of cycles, 1000 km or 1 year of use, based on the value reached first. In different conditions, it could be necessary to refill more often, depending on the level of environment criticality. In case of severe dust and dirt conditions, it is suggested to change the entire wiper head with a new one.

When refilling the oil or the substituting the wiper heads, it is recommended to clean the raceways of the guide.

Lubricant	Thickening agent	Temperature range [°C]	Kinematic viscosity 40°C [mm²/s]
Mineral oil	Lithium soap	-20... to +120	approx 110

Tab. 69

> CSW-slider lubrication

Lubrication when using C-sliders

The CSW series sliders can be provided with wipers made of thermoplastic elastomer to remove contaminants on the raceways. Since the sliders do not have a self-lubrication kit, manual lubrication of the raceways is

required. A guideline is to lubricate the raceways every 100 km or every 6 months. We recommend a roller bearing lubricant with a lithium base of average consistency (see tab. 70).

Lubricant	Thickening agent	Temperature range [°C]	Kinematic viscosity 40°C [mm²/s]
Roller bearing lubricant	Lithium soap	-20 to +170	approx 160

Tab. 70

Different lubricants are available on request for special applications:

- FDA-approved lubricant for use in the food industry
- specific lubricant for clean rooms

- specific lubricant for the marine technology sector

- specific lubricant for high and low temperatures

For specific information, contact Rollon technical support.

> Corrosion protection

All rails and slider bodies have a standard corrosion protection system by means of electrolytic-zinc plating according to ISO 2081. If increased corrosion protection is required, application-specific surface treatments are available upon request for rails and slider bodies e.g. approved nickel

plated for use in the food industry. In this case, the chosen treatment must be specified in the order for both rails and sliders using the appropriate code shown in the table below. For more information contact Rollon technical support.

Treatment	Characteristics
Zinc Plating ISO 2081	Standard treatment for all sizes of rails and slider bodies, it is ideal for indoor applications. When applied to the rail, it is removed from the raceways by the subsequent grinding process. Zinc-plated sliders are supplied with steel rollers.
ZincNickel ISO19598 (Z)	Ideal for outdoor applications. Sliders ordered with ZincNickel treatment are supplied with stainless steel rollers to further increase the corrosion resistance.
Rollon E-coating (K)	As zinc-plated version with additional electro painting that provides a fine black finishing to the entire rail. When applied to the rail, the slider can partially remove the coating from the raceways on the running contact point after a period of use. Sliders ordered with Rollon E-Coating are supplied with stainless steel rollers to further increase the corrosion resistance.
Nickel Plating (N)	Provides high resistance to chemical corrosion and is ideal for applications in medical or food related environments. When applied to the rail, raceways are coated too. Sliders ordered with Nickel Plating treatment are supplied with stainless steel rollers to further increase the corrosion resistance.

Tab. 71

> Speed and acceleration

The Compact Rail product family is suitable for high operating speeds and accelerations.

Size	Speed [m/s]	Acceleration [m/s²]
18	3	10
28	5	15
35	6	15
43	7	15
63	9	20

Tab. 72

> Operating temperatures

The temperature range for continuous operation is: -20 °C / +120 °C with occasional peaks up to +150 °C.

Installation instructions

> Fixing holes

V-holes with 90° bevels

The selection of rails with 90° countersunk holes is based on the precise alignment of the threaded holes for installation. Here the complex alignment of the rail to an external reference is omitted, since the rail aligns during installation by the self-centering of the countersunk screws on the existing hole pattern.

Fig. 151

C-holes with cylindrical counterbore

When a rail with counterbored holes is delivered, the Torx® screws are provided in the right quantity. The cylindrical screw has, as shown, some play in the countersunk fixing hole, so that an optimum alignment of the rail can be achieved during installation (see fig. 152).

The area T is the diameter of the possible offset, in which the screw center point can move during the precise alignment.

Fig. 152

Rail type	Area T [mm]
TLC18 - ULC18	Ø 1.0
TLC28 - ULC28	Ø 1.0
TLC35 - ULC35	Ø 1.5
TLC43 - ULC43 - KLC43	Ø 2.0
TLC63 - ULC63 - KLC63	Ø 0.5

Tab. 73

Chamfers

Chamfers must be realized for both C-holes and V-holes rails. The minimum chamfers on the fixing threads are listed on the table below.

Size	Chamfer C-holes [mm]	Chamfer V-holes [mm]
18	0.5 x 45°	0.5 x 45°
28	0.6 x 45°	1 x 45°
35	0.5 x 45°	1 x 45°
43	1 x 45°	1 x 45°
63	0.5 x 45°	1 x 45°

Tab. 74

Example for fixing with Torx® screws (custom design)

Example for fixing with countersunk screws

Fig. 153

> Adjusting the sliders

If requested in the order, rails and sliders are delivered as a system with factory adjustment. If rails and sliders are supplied separately or if the slider is to be mounted in another rail, the bearings will need to be adjusted.

- (1) Check that the rails are clean and remove the wipers to increase sensitivity for proper preload.
- (2) Place the slider in the rail. It may be necessary to align the bearings to be adjusted with those fixed, to facilitate insertion. Excessive offset may make insertion difficult. Use the flat spanner.
- (3) Use a medium threadlocking adhesive in the screws.
- (4) Lightly tighten the upper bearing screw without over-tightening. Vice versa if the screw has already been previously tightened, loosen the bearing fixing screws slightly. The bearing must be able to rotate but should not be completely free. Only adjust the eccentric bearings (without the center marked).
- (5) For NSW/NSA/NSD/NSDA series, place the slider at one end of the rail to simplify insertion of the flat key. For the CSW/CDW series, adjustment can take place at any point on the rail, if desired.
- (6) Insert the flat spanner supplied between the rail and the slider. For NSW/NSA/NSD/NSDA series take care to insert it from the end of the slider, sliding it under the side seal until it reaches the bearing to be adjusted. (Fig. 154). Engage the hexagon of the eccentric bearing

Fig. 154

- with the flat spanner.
- (7) Turn the flat adjustment spanner clockwise so that the eccentric bearings contacts the raceway opposite the factory-set fixed bearings, thus reducing the slider clearance to zero. Avoid applying a high preload, which would cause high wear and reduce service life.
- (8) While holding the eccentric bearing in the correct position with the flat adjusting spanner, tighten the fixing screw to ensure a stable pin position.
- (9) Run the slider and check the preload over the entire length of the rail. The movement must be smooth. If any oscillation/clearance or excessive force is observed, repeat the adjustment operation. Preload is optimized when the slider runs smoothly and without play.
- (10) For sliders with more than 3 eccentric bearings, repeat this procedure for each one to be adjusted. Ensure that all bearings have uniform contact with the raceways.
- (11) While maintaining the angular position of the pin with the flat spanner, tighten all the bearing retaining screws with a torque spanner to the specified tightening torque shown in Table 75.
- (12) Reinstall the wipers.
- (13) For CSW/CDW series, lubricate the raceways.

Slider size	Tightening torque [Nm]
18	3
28	7
35	7

28	0,64	10 + 0,03/+0,01	4,0	0,5
35	0,90	12 + 0,05/+0,02	4,5	0,5
43	0,72	12 + 0,05/+0,02	5,5	1
63	0,55	18 + 0,02/-0,02	7	1

Tab. 76

If purchasing "Radial ball bearing rollers" to install on your own structure (see p. CR-74) we advise:

- Using a maximum of 2 concentric radial ball bearing rollers
- Offset the seats of the concentric radial ball bearing rollers with respect to those of the eccentric radial ball bearing rollers according to the table (tab. 76).

Fig. 156

> Installing the single rail

The T- and K-rails can be installed in two positions relative to the external force. For axial loading of the slider (fig. 157. pos. 2), the load capacity is reduced because of the decline in contact area caused by the change in position. Therefore, the rails should be installed in such a way that the load on the rollers acts in the radial direction (fig. 157, pos. 1). The number of fixing holes in the rail in combination with screws of property class 10.9 is dimensioned in accordance with the load capacity values. For critical applications with vibrations or higher demand for rigidity, a support of the rail (fig. 157, pos. 3) is advantageous.

This reduces deformation of the sides and the load on the screws. The installation of a rail with countersunk holes requires an external reference for alignment. This reference can also be used simultaneously as rail support if required. All information in this section on alignment of the rails, refers to rails with counterbored holes. Rails with countersunk holes self-align using the specified fixing hole pattern (see pg. CR-91, fig. 151).

Fig. 157

Rail installation with reference surface as support

- (1) Remove unevenness, burrs and dirt from the support surface.
- (2) Press the rail against the support surface and insert all screws without tightening them.
- (3) Start tightening the fixing screws to the specified torque on one end of the rail while continuing to hold pressure on the rail against the support surface.

Fig. 158

Screw type	Torx® tightening torque [Nm]	Countersunk tightening torque [Nm]
M4 (T..., U... 18)	3	3
M5 (T..., U... 28)	9	6
M6 (T..., U... 35)	12	10
M8 (T..., U..., K... 43)	22	25
M8 (T..., U..., K... 63)	35	30

Tab. 77

Fig. 159

Rail installation without support

(1) Carefully lay the guide rail with installed slider on the mounting surface and slightly tighten the fixing screws so that the guide rail lightly touches the mounting surface.

Fig. 160

(2) Install a dial indicator so that the offset of the rail to a reference line can be measured. Now position the slider in the center of the rail and set the dial indicator to zero. Move the slider back and forth between each two hole spacings and carefully align the rail. Fasten the three center screws of this area now with the specified tightening torque, see pg. fig. 161.

(3) Now position the slider on one end of the rail and carefully align the rail to zero on the dial indicator.

Fig. 161

(4) Begin to tighten the screws as specified while moving the slider together with the dial indicator. Make sure that it does not show any significant deflection. Repeat this procedure from the other end of the rail.

Fig. 162

> Parallel installation of two rails

If two T-rails or a T+U-system are installed, the height difference of the two rails must not exceed a certain value (obtainable from the table below) in order to ensure proper guiding. These maximum values result from the maximum allowable twisting angle of the rollers in the raceways (see tab. 78). These values account for a load capacity reduction of 30% on the T-rail and must absolutely be maintained in every case.

Fig. 163

Size	α
18	1 mrad (0.057°)
28	2.5 mrad (0.143°)
35	2.6 mrad (0.149°)
43	3 mrad (0.171°)
63	5 mrad (0.286°)

Tab. 78

Example:

NSW43: if $a = 500 \text{ mm}$; $b = a \cdot \tan \alpha = 1.5 \text{ mm}$

When using two T-rails, the maximum parallelism deviation must not be exceeded (see tab. 79). Otherwise stresses can occur, which can result in a reduction in load capacity and service life.

Rail size	K1	K2
18	0.03	0.02
28	0.04	0.03
35	0.04	0.03
43	0.05	0.04
63	0.06	0.05

Tab. 79

Fig. 164

Note: For parallelism problems, it is recommended to use a T+U or K+U system, since these combinations compensate for inaccuracies (see pg. CR-80 and following).

Parallel installation of two T-rails

(1) Clean chips and dirt from the prepared mounting surfaces and fasten the first rail as described in the section on installation of a single rail.

(2) Fasten the second rail on the ends and the center. Tighten the screws in Position A and measure the distance between the raceways of the two rails.

Fig. 165

(3) Fasten the rail in Position B so that the distance between the raceways does not exceed the measured values in Position A while maintaining the tolerances (see pg. CR-95, tab. 79) for parallel rail installation.

Fig. 166

(4) Fasten the screw in Position C so that the distance of the raceways is as close to an average between the two values from A and B as possible.

(5) Fasten all other screws and check the specified tightening torque of all fixing screws (see pg. CR-94, tab. 77).

Fig. 167

> Installation of the T+U- or the K+U-system

When using a two-track parallel linear guide we recommend the use of a fixed bearing / compensating bearing system: The combination of T+U-rails for compensation of deviations in parallelism or the K+U-system to compensate for deviations in parallelism in two planes.

Installation steps

(1) For a fixed bearing / compensating bearing system the fixed bearing rail is always installed first. This is then used as a reference for the compensating bearing rail.

Then proceed as described in the section on installation of a single rail (see pg. CR-95).

(2) Install the compensating bearing rail and only tighten the fixing screws slightly.

(3) Insert the sliders in the rails and install the element to be moved, without tightening its screws.

(4) Insert the element in the center of the rails and tighten it, use screws class 10.9.

(5) Tighten the center rail fixing screws to the specified torque (see pg. CR-94, tab. 77).

(6) Move the element to one end of the rail and start tightening the rest of the screws in the direction away from the slider.

Fig. 168

Fig. 169

Fig. 170

> Joined Rails

If long guide rails are required, two or more rails can be joined to the desired length. When putting guide rails together, be sure that the register marks shown in fig. 171 are positioned correctly.

For applications with parallel joined guide rails we suggest them to be fabricated asymmetric.

Fig. 171

General information

The maximum available rail length in one piece is indicated in table 40 on page CR-59. Longer lengths are achieved by joining two or more rails (joined rails).

Rollon then machines the rail ends at a right angle to the impact surfaces and marks them. Additional fixing screws are included with the delivery, which ensure a problem-free transition of the slider over the joints, if the following installation procedures are followed. Two additional threaded holes (see fig. 172) are required in the load-bearing structure. The included end fixing screws correspond to the installation screws for the rails for cylindrical counterbores (see pg. CR-91).

The alignment fixture for aligning the rail joint can be ordered using the designation given in the table (see pg. CR-75, tab. 54 and 55).

Fig. 172

Rail type	A [mm]	Threaded hole (load-bearing structure)	Screw type	L [mm]	Alignment fixture
T..., U...18	7	M4	see pg. CR-91	8	AT18

K...63	8	M8		20	AK63

Tab. 80

> Installation of joined rails

After the fixing holes for the rails are made in the load-bearing structure, the joined rails can be installed according to the following procedure:

- (1) Fix the individual rails on the mounting surface by tightening all screws except for each last one on the rail joint.
- (2) Install the end fixing screws without tightening them (see fig. 173).

Fig. 173

- (3) Place the alignment fixture on the rail joint and tighten both set screws uniformly, until the raceways are aligned (see fig. 174).
- (4) After the previous step (3) it must be checked if both rail backs lie evenly on the mounting surface. If a gap has formed there, this must be shimmed.

Fig. 174

- (5) The bottom of the rails should be supported in the area of the transition. Here a possible existing gap must be looked for, which must be closed for correct support of the rail ends by shims.

Fig. 175

- (6) Insert the key through the holes in the alignment fixture and tighten the screws on the rail ends.
- (7) For rails with 90° countersunk holes, tighten the remaining screws starting from the rail joint in the direction of the rail center. For rails with cylindrical counter-sunk holes, first adjust the rail to an external reference, then proceed as described above.
- (8) Remove the alignment fixture from the rail.

Note on ordering: every kit contains a pair of wipers. Two wipers per slider are always required.

Calculation formulas

> Static load

The radial load capacity rating, C_{0rad} , the axial load capacity rating C_{0ax} , and moments M_x , M_y , M_z indicate the maximum permissible values of the load (see from pg. CR-8 to CR-10 and CR-54, CR-57), higher loads will have a detrimental effect on the running quality. A safety factor, S_0 , is used to check the static load, which takes into account the basic parameters of the application and is defined more in detail in the following table:

Safety factor S_0

No shock nor vibration, smooth and low-frequency reverse, high assembly accuracy, no elastic deformations	1 - 1.5
Normal installation conditions	1.5 - 2
Shock and vibration, high-frequency reverse, significant elastic deformation	2 - 3.5

Fig. 177

The ratio of the actual load to maximum permissible load may be as large as the reciprocal of the accepted safety factor, S_0 , at the most.

$\frac{P_{0rad}}{C_{0rad}} \leq \frac{1}{S_0}$	$\frac{P_{0ax}}{C_{0ax}} \leq \frac{1}{S_0}$	$\frac{M_1}{M_x} \leq \frac{1}{S_0}$	$\frac{M_2}{M_y} \leq \frac{1}{S_0}$	$\frac{M_3}{M_z} \leq \frac{1}{S_0}$
--	--	--------------------------------------	--------------------------------------	--------------------------------------

Fig. 178

The above formulas are valid for a single load case.

If two or more forces are acting simultaneously, please check the following formula:

$\frac{P_{0rad}}{C_{0rad}} + \frac{P_{0ax}}{C_{0ax}} + \frac{M_1}{M_x} + \frac{M_2}{M_y} + \frac{M_3}{M_z} + y \leq \frac{1}{S_0}$	<p>P_{0rad} = effective radial load (N)</p> <p>C_{0rad} = permissible radial load (N)</p> <p>P_{0ax} = effective axial load (N)</p> <p>C_{0ax} = permissible axial load (N)</p> <p>M_1, M_2, M_3 = external moments (Nm)</p> <p>M_x, M_y, M_z = maximum permissible moments in the different loading directions (Nm)</p> <p>y = reduction due to preload (see pg. CR-29, Tab. 20 or pg. CR-85, Tab. 65)</p>
--	--

Fig. 179

The safety factor S_0 can lie on the lower given limit if the occurring forces can be determined with sufficient precision. If shock and vibration are

present, the higher value should be selected. For dynamic applications higher safety is required. Please contact Rollon technical support.

> Slider load

Examples of formulas for determining the forces on the most heavily loaded slider

For an explanation of the parameters in the formulas see pg. CR-106, fig. 194

Fig. 180

Slider load:

$$P_1 = F \cdot \frac{b}{a+b}$$

$$P_2 = F - P_1$$

in addition each slider is loaded by a moment:

$$M_1 = \frac{F}{2} \cdot c$$

Fig. 183

Fig. 181

Slider load:

$$P_{1a} \cong P_{2a} = \frac{F}{2}$$

$$P_{2b} \cong P_{1b} = F \cdot \frac{a}{b}$$

Fig. 184

Fig. 182

Slider load:

$$P_2 = F \cdot \frac{a}{b}$$

$$P_1 = P_2 + F$$

Fig. 185

Note: Applies only if the distance between centers of the sliders $b > 2x$ slider length

Fig. 186

Note: It is defined that slider no. 4 is always located closest to the point where the force is applied.

Slider load:

$$P_1 = \frac{F}{4} - \left(\frac{F}{2} \cdot \frac{b}{c} \right) - \left(\frac{F}{2} \cdot \frac{a}{d} \right)$$

$$P_2 = \frac{F}{4} - \left(\frac{F}{2} \cdot \frac{b}{c} \right) + \left(\frac{F}{2} \cdot \frac{a}{d} \right)$$

$$P_3 = \frac{F}{4} + \left(\frac{F}{2} \cdot \frac{b}{c} \right) - \left(\frac{F}{2} \cdot \frac{a}{d} \right)$$

$$P_4 = \frac{F}{4} + \left(\frac{F}{2} \cdot \frac{b}{c} \right) + \left(\frac{F}{2} \cdot \frac{a}{d} \right)$$

Fig. 189

Fig. 187

Slider load:

$$P_1 \cong P_2 = F \cdot \frac{a}{b}$$

Fig. 190

Note: Applies only if the distance between centers of the sliders $b > 2x$ slider length

Fig. 188

Slider load:

$$P_1 = F$$

$$M_2 = F \cdot a$$

Fig. 191

Fig. 192

Horizontal movement

Test with a moving element of the weight-force F_g at the instant the direction of movement changes

Inertial force

$$F = m \cdot a$$

Slider load at time of reverse

$$P_1 = \frac{F \cdot l}{d} + \frac{F_g}{2}$$

$$P_2 = \frac{F_g}{2} - \frac{F \cdot l}{d}$$

Fig. 193

Explanation of the calculation formula

- F = effective force (N)
- F_g = weight-force (N)
- P_1, P_2, P_3, P_4 = effective load on the slider (N)
- M_1, M_2 = effective moment (Nm)
- m = mass (kg)
- a = acceleration (m/s^2)

Fig. 194

> Service life

The dynamic load capacity C is a conventional variable used for calculating the service life. This load corresponds to a nominal service life of 100 km. For values of the individual slider see from pg. CR-8 to CR-10 and CR-54, CR-57. The following formula (see fig. 195) links the calculated theoretical service life to the dynamic load capacity and the equivalent load:

$$L_{km} = 100 \cdot \left(\frac{C}{P} \cdot \frac{f_c}{f_i} \cdot f_h \right)^3$$

L_{km} = theoretical service life (km)
 C = dynamic load capacity (N)
 P = effective equivalent load (N)
 f_c = contact factor
 f_i = application coefficient
 f_h = stroke factor

Fig. 195

The equivalent load P corresponds in its effects to the sum of the forces and moments working simultaneously on a slider. If these different load components are known, P results as follows:

$$P = P_r + \left(\frac{P_a}{C_{0ax}} + \frac{M_1}{M_x} + \frac{M_2}{M_y} + \frac{M_3}{M_z} + y \right) \cdot C_{0rad}$$

y = reduction due to preload
 (see pg. CR-29, Tab. 20 or pg. CR-85, Tab. 65)

Fig. 196

Here the external loads are assumed as constant in time. Brief loads, which do not exceed the maximum load capacities, do not have any relevant effect on the service life and can therefore be neglected.

The contact factor f_c refers to applications in which several sliders pass the same rail section. If two or more sliders move over the same point of a rail, the contact factor according to table 81 to be taken into account in the formula for calculation of the service life.

Number of sliders	1	2	3	4
f_c	1	0.8	0.7	0.63

Tab. 81

The application coefficient f_i takes into account the operational conditions in the service life calculation. It has a similar significance to the safety factor S_0 in the static load test. It is calculated as described in the following table:

f_i	
Neither shocks nor vibrations, smooth and low-frequency direction change; clean operating conditions; low speeds (<1 m/s)	1 - 1.5
Slight vibrations, average speeds (1 - 2.5 m/s) and average frequency of direction change	1.5 - 2
Shocks and vibrations, high speeds (> 2.5 m/s) and high-frequency direction change; extreme dirt contamination	2 - 3.5

Tab. 82

The stroke factor f_h takes into account the higher load of the raceways and rollers during short strokes on the same total length of run. The corresponding values are taken from the following graph (for strokes longer than 1 m, $f_h = 1$):

Fig. 197

ROLLON®
BY TIMKEN

X-Rail

New X-Rail

A versatile linear guide in zinc-plated steel, stainless steel or hardened steel. It simplifies the project, improves the performance and reduces the application cost: **6 main advantages**

1

Self-aligning system

- Select the most suitable structure for your project
- Avoid machining the mounting surface
- Reduce the assembly time

Up to 3.5 mm
with T+U rails

2

Cost effective rolled steel profile

High quality low carbon cold rolled steel profile with high yield strength

3

Resistant to corrosion

Different surface treatments and materials make X-Rail reliable in different application environments

- **Indoor applications:** zinc-plating ISO 2081, Rollon Nox
- **Outdoor applications:** stainless steel AISI 316L

The best-performing series PLUS

Steel rails hardened with **Rollon-Nox treatment** of deep nitriding and oxidation for a longer lifetime and higher load capacities.

↓ +40%*

* Example referred to size 30.

4

Easy assembly

Easily mount the guide on non-machined structures, reducing total assembly time

Simple roller adjustment to regulate the sliding force perception in assembly phase

5

Optimal reliability in dirty environments

Newly designed polymer heads for an optimal cleaning of the raceways

Also available with slow release lubricating felt for low maintenance

6

Strength and sturdiness

Thanks to steel slider body

Product explanation

- > **X-Rail: linear bearings in stainless steel, zinc-plated steel or hardened steel with Rollon-Nox process.**

Fig. 1

X-Rail is the product family of roller embossed guide rails for applications in which an economical price to performance ratio and high corrosion resistance are required.

X-Rail linear guides features a rolled C-profile (0 degrees of axial play) or U-profile (1 degree of axial play) and are available in three versions: hardened with Rollon-Nox patented process of deep nitriding and oxidation (N/P-series), zinc-plated steel ISO 2081 (S-series) and stainless steel (X-series). Sizes range from 20 to 45 mm depending on the material of the guide and the type of profile. Every option features dedicated sliders, with compact or solid body.

The most important characteristics:

- Corrosion resistant, FDA/USDA compliant materials
- Compensates for deviations in mounting structure parallelism
- Optimal reliability in dirty environments thanks to internal raceways
- Wide range of operating temperature
- Easy adjustment of sliders

Preferred areas of application of the X-Rail product family:

- Construction and machine technology
(e.g., safety doors, washing bay accessories)
- Medical technology
(e.g., hospital accessories, medical equipment)
- Transport (e.g., rail transport, naval, automotive industry)
- Food and beverage industry (e.g., packaging, food processing)
- Building technology
- Energy technology (e.g., industrial furnaces, boilers)

N/P-series

Linear guides and sliders made of hardened steel. The Rollon-Nox hardening process provides the guide with long life and resistance to wear, in addition to a black surface resistant to flame and abrasion. Sliders feature newly designed polymer heads with slow release lubricating felt for low maintenance and an optimal cleaning of the raceways.

Fig. 2

S-series

Linear guides and sliders made of zinc-plated steel. They offer a simple and economical solution for a wide range of applications where high frequency is not required.

Good load capacity/size ratio, tailored designed sliders and ease of assembly are the features that make this product a winning choice compared to self-built or other similar solutions on the market.

Fig. 3

X-series

Linear guides and sliders in stainless steel AISI 316L (1.4404) and bearings in AISI 440 (1.4125). They offer a simple and practical solution for all applications where high corrosion resistance is required, in particular for food industry, chemical, pharmaceutical and medical industries. The product is easily washable for applications subject to frequent cleaning.

For applications in severe marine environments is available the electro-polished version for very high corrosion resistances.

Fig. 4

System (T+U-System)

T and U-rail can be used together for compensating deviations in parallelism and tolerances in the mounting structure. The T-rail (fixed rail) bears the main load while the U-rail with flat raceways (compensating rail) allows the bearings to travel axially without constraints.

Fig. 5

Rollers

Concentric and eccentric radial ball bearings made of stainless or roller bearing steel are available for each slider. Roller sealing is dependent on the material: 2RS rubber seals or 2Z steel shields. All rollers are lubricated for life.

Fig. 6

Technical data

Example of S-series / X-series

Fig. 7

Example of N/P-series

Fig. 8

Performance characteristics:

- Max. slider operating speeds in the linear bearing rails: 1.5 m/s (59 in/s) (depending on application)
- Max. acceleration: 2 m/s² (78 m/s²) (depending on application)
- Available rail lengths: from 160 mm to 4000 mm (from 6,3 in to 157 in) in 80 mm increments (3,15 in).
- Rollers lubricated for life

TEN, TEP, UEN, UEP guides

- Available sizes: 26-30-40 type T, 30-40 type U
- Max. radial load capacity: 3240 N
- Operating temperature range: -20 °C to +120 °C (-4°F to +248°F)
- Rail material: S420MC steel hardened with Rollon-Nox patented process
- Rollers material: carbon steel with 2Z shield (dust cover seal)

TES, UES guides

- Available sizes: 20-26-30-40-45 type T, 30-40-45 type U
- Max. radial load capacity: 1740 N
- Operating temperature range: -20 °C to +120 °C (-4°F to +248°F)
- Rail material: S420MC (size 26-30-40) or S355MD (size 20-45) zinc-plated steel ISO 2081
- Rollers material: carbon steel with 2Z shield (dust cover seal)

TEX, UEX guides

- Available sizes: 20-26-30-40-45 type T, 30-40-45 type U
- Max. radial load capacity: 1600 N
- Operating temperature range: -20 °C to +100°C (-4 °F to +212 °F)
- Rail material: stainless steel AISI 316L (1.4404)
- Rollers material: stainless steel AISI 440C (1.4125) with 2RS shield (splashproof seal)

Remarks:

- The sliders are equipped with rollers that are in alternating contact with both sides of the raceway. Markings on the body around the outer roller pins indicate the correct arrangement of the rollers to the external load.
- All the rails are engraved with a tracking code that identifies the production batch.
- With a simple adjustment of the eccentric roller, clearance or the desired preload can be set on the rail and slider.
- Different sliders are available depending on the type and the size of the linear guide. Refer to every chapter for details.
- We do not recommend combining (join together) the rails.
- Recommended fixing screws: ISO 7380 with low head height (special TORX® screws are available on request).
- Do not use in applications with high number of cycles. For further information, please contact Rollon Technical Department.

Technical instructions

> Lubrication

All sliders CEN/CEP are supplied with high quality thermoplastic elastomer wipers with optimized lips and a synthetic felt soaked in lubricating oil, which releases a thin lubricating film on the raceways and ensures proper operation. The period of self-lubrication depends on the conditions of use and the level of environmental cleanliness. In normal conditions, the self-lubricating wipers can last up to 1000 km, then they need to be replaced with a new pair. New wipers can be ordered from Rollon using the codes shown on pag. XR-24. To replace them, simply extract the old ones and insert the new ones frontally. The rollers are lubricated for life with grease lithium soaps and feature 2Z lateral seals.

Fig. 55

Other sliders can be supplied with wipers in high quality thermoplastic elastomer, without lubricating felt. Please check the availabilities from pag. XR-10 to XR-19, and contact our Technical Department for wipers indicated as „on request“. In this case it is advisable to lubricate the raceways with specific bearing grease. The interval between lubrication treatments depends mainly on environmental conditions, bearing speed and temperature. Under normal conditions, it is advisable to lubricate locally after 100 km of use or after six months of service. In case of critical applications, lubrication treatments should be more frequent. Before lubricating, remember to clean the raceway surfaces carefully. We advise using a lithium grease of medium consistency for rolling-element bearings. The rollers are lubricated for life with grease lithium soaps and feature 2RS or 2Z lateral seals.

Fig. 56

Different lubricants are available on request for special applications:

- FDA-approved lubricant for use in the food industry
- specific lubricant for clean rooms
- specific lubricant for the marine technology sector
- specific lubricant for high and low temperatures

For specific information, contact Rollon technical support.

Under normal conditions, correct lubrication:

- reduces friction
- reduces wear
- reduces stress on contact surfaces due to elastic deformation
- reduces noise during operation
- increases the regularity of the rolling movement

> T+U-System

Fig. 57

Solves axial deviations in parallelism

Mounting two linear bearing rails in a parallel manner is always important but rarely easy. Distortions in axial alignment can drastically reduce the life of the rails. These distortions can bind and overload sliders. Combining shaped and flat raceways it is possible to compensate axial deviation in parallelism of the mounting surfaces without additional modifications of those surfaces. T+U rails easily address these alignment issues to create an economical parallel rail system.

In a T+U-System, the slider in the T rail carries axial and radial loads and guides the movement of the U, which has lateral freedom.

U rails have flat parallel raceways that allow free lateral movement of the sliders. The maximum freedom a slider in the U rail can offer can be calculated using the values S_1 and S_2 (see fig. 58, tab. 47 and the formula in fig. 59). With nominal value B_{nom} as the starting point, S_1 indicates the maximum allowed movement into the rail, while S_2 represents the maximum offset towards the outside of the rail.

If the length of the guide rail is known, the maximum allowable angle deviation of the mounting surface (fig. 60 and tab. 48) can be calculated. In this case the slider in the U rail has the freedom to travel from the innermost position S_1 to the outermost position S_2 .

Maximum offset

45	4000	3.5	0.050

Tab. 48

> Service life calculation for N/P-series

The calculation of service life can be done only for rails with nitrided raceways, for which the dynamic load capacity C is given. The dynamic load capacity C is a conventional variable that corresponds to a nominal

service life of 100 km. For values of the individual slider see pg. XR-5. The following formula (see fig. 61) links the calculated theoretical service life to the dynamic load capacity and the equivalent load:

Fig. 61

The equivalent load P corresponds in its effects to the sum of the forces working simultaneously on a slider. If these different load components are known, P results as follows:

Fig. 62

Here the external loads are assumed as constant in time. Brief loads, which do not exceed the maximum load capacities, do not have any relevant effect on the service life and can therefore be neglected.
The contact factor f_c refers to applications in which several sliders pass the same rail section. If two or more sliders move over the same point of a rail, the contact factor according to table 49 to be taken into account in the formula for calculation of the service life.

Number of sliders	1	2	3	4
f_c	1	0.8	0.7	0.63

Tab. 49

The application coefficient f_i takes into account the operational conditions in the service life calculation. It is calculated as described in the following table:

f_i	
Neither shocks nor vibrations, smooth and low-frequency direction change; clean operating conditions; low speeds (<1 m/s)	1 - 1.5
Slight vibrations, average speeds (1 - 1.5 m/s) and average frequency of direction change	1.5 - 2
Shocks and vibrations, high speeds (> 1.5 m/s) and high-frequency direction change; extreme dirt contamination	2 - 3.5

Tab. 50

The stroke factor f_h takes into account the higher load of the raceways and rollers during short strokes on the same total length of run. The corresponding values are taken from the following graph (for strokes longer than 1 m, $f_h = 1$):

Fig. 63

> Static load

The radial load capacity rating, C_{Orad} , the axial load capacity rating C_{Oax} , indicate the maximum permissible values of the load (see pg. XR-5), higher loads will have a detrimental effect on the running quality. A safety factor, S_0 , is used to check the static load, which takes into account the basic parameters of the application and is defined more in detail in the following table:

Safety factor S_0

No shock nor vibration, smooth and low-frequency reverse, high assembly accuracy, no elastic deformations	1 - 1.5
Normal installation conditions	1.5 - 2
Shock and vibration, high-frequency reverse, significant elastic deformation	2 - 3.5

Fig. 64

The ratio of the actual load to maximum permissible load may be as large as the reciprocal of the accepted safety factor, S_0 , at the most.

$$\frac{P_{Orad}}{C_{Orad}} \leq \frac{1}{S_0}$$

$$\frac{P_{Oax}}{C_{Oax}} \leq \frac{1}{S_0}$$

Fig. 65

The above formulas are valid for a single load case.
If two or more forces are acting simultaneously, please check the following formula:

$$\frac{P_{Orad}}{C_{Orad}} + \frac{P_{Oax}}{C_{Oax}} \leq \frac{1}{S_0}$$

P_{Orad} = effective radial load (N)
 C_{Orad} = permissible radial load (N)
 P_{Oax} = effective axial load (N)
 C_{Oax} = permissible axial load (N)

Fig. 66

The safety factor S_0 can lie on the lower given limit if the occurring forces can be determined with sufficient precision. If shock and vibration are present, the higher value should be selected. For dynamic applications higher safety is required. Please contact Rollon technical support.

> Adjusting the slider

If requested in the order, rails and sliders are delivered as a system with factory adjustment. If rails and sliders are supplied separately or if the slider is to be mounted in another rail, the bearings will need to be adjusted. The suitable approach is the hexagonal spanner for sliders size 26, 40 and the flat spanner for sliders size 20,30,45. CEP30 slider can be adjusted in both ways.

Common preliminary operations:

- (1) Check that the raceways are clean and remove the wipers, to increase sensitivity for proper preload.
- (2) Place the slider in the rail. It may be necessary to align the bearings to be adjusted with the fixed ones to facilitate insertion, since excessive offset may make insertion difficult. Use a flat or hexagonal spanner.
- (3) Use a medium threadlocking adhesive in the screws.
- (4) Lightly tighten the upper bearing screw without over-tightening. Vice versa if the screw has already been previously tightened, loosen it slightly. The bearing must be able to rotate but should not be completely free. Only adjust the excentric bearings (without the center marked).

With flat spanner

- (5) For the U-rails there must be a thin support (e.g. set key) under the ends of the slider body to ensure the horizontal alignment of the slider in the flat raceways.
- (6) The adjustment can take place at any point on the rail. If possible, position the slider at one end of the rail to simplify insertion of the flat spanner.
- (7) Insert the flat spanner supplied to the side and use it to engage the hexagonal or square shaft of the eccentric pin to be adjusted (see fig. 67).
- (8) Turn the flat adjustment spanner clockwise so that the excentric bearing contacts the raceway opposite the factory-set fixed bearings, thus reducing the slider clearance to zero. Avoid applying a too high preload, which would cause high wear and reduce service life.
- (9) While holding the pin in the correct position with the flat adjustment spanner, tighten the fixing screw to ensure that the pin is locked in position.
- (10) Run the slider and check the preload over the entire length of the rail. The movement must be smooth. If any oscillation/clearance or excessive force is observed, repeat the adjustment operation. Preload is optimized when the slider runs smoothly and without play.
- (11) Preload values can be checked by slowly inserting the slider at the end of the rails. The insertion force is proportional to the preload. Preload is optimized when the slider runs smoothly and without play.
- (12) For sliders with more than 3 bearings, repeat this procedure for each one to be adjusted. Ensure that all bearings have uniform contact with the raceways.
- (13) While maintaining the angular position of the pin with the flat spanner, tighten the adjusted bearing fixing screw with a torque spanner. The prescribed tightening torque is shown in table 51.
- (14) Reinstall the wipers.

Fig. 67

With hexagonal spanner

- (5) Lock the rail on a stable support so that your hands are free.
- (6) Insert the hexagonal spanner into the excentric pin, passing it through one of the fixing holes in the rail.
- (7) Turn the hexagonal key slightly so that the excentric bearings contacts the raceway opposite the factory-set fixed bearings, thus reducing the slider clearance to zero. When turning, support the upper screw by turning in the same direction with a second hexagonal spanner to prevent loosening or changes in preload settings.
- (8) While firmly holding the hexagonal spanner inserted in the excentric bearing with one hand, use the other hexagonal spanner to turn and tighten the upper screw of the pin. Do not lock or unlock the excentric bearing by rotating the pin: always turn the top screw.
- (9) Run the slider and check the preload over the entire length of the rail. The movement must be smooth. If any oscillation/clearance or excessive force is observed, repeat the adjustment operation. Preload is optimized when the slider runs smoothly and without play.
- (10) Preload values can be checked by slowly inserting the slider at the end of the rails. The insertion force is proportional to the preload. Preload is optimized when the slider runs smoothly and without play.
- (11) For sliders with more than 3 bearings, repeat this procedure for each one to be adjusted. Ensure that all bearings have uniform contact with the raceways.
- (11) Tighten the pin/screw definitively using a torque spanner to ensure the correct tightening torque, in accordance with the values in table 51, while holding the hexagonal spanner to the pin, to avoid variations in the preload parameters. Always turn the top screw to lock or loosen the bearing.
- (12) Reinstall the wipers.

Tab. 51

> Use of rollers

Fig. 69

If purchasing "Radial ball bearing rollers" to install on your own structure (see from p. XR-20 to XR-24) we advise:

- Using a maximum of 2 concentric rollers
- Offset the seats of the concentric rollers with respect to those of the eccentric rollers according to the table (tab. 52).
- To install rollers type CPN/CPA, CPNX/CPAX, CRN/CRA, CRNX/CRAX it is necessary to make a slot in the structure according to the dimensions shown on Fig. 69.
- Two concentric and two eccentric rollers are recommended for the four-roller slider. The two concentric rollers must be engaging on the lower raceway of the rail.

Maintain the recommended offset distance between the midpoint line of the concentric rollers and those of the eccentric rollers (fig. 70).

Fig. 70

Slider size	X [mm]	Ø A [mm]	B min. [mm]	Radius R [mm]
20	0.60	6 +0.01/+0.03	2.1	0.5
26	0.40	-	-	-
30 (CES.../CEX...)	0.63	10 +0.01/+0.03	4.1	0.5
30 (CEP...)	0.40	-	-	-
40	0.90	-	-	-
45	0.60	12 +0.01/+0.03	5	1

Tab. 52

- Two concentric rollers are recommended for the slider with five or more rollers (fig. 71). The two concentric rollers must be engaging on the lower raceway of the rail. The other rollers must all be eccentric and engaging on the upper or lower raceway of depending on the application. Maintain the recommended offset distance between the midpoint line of the concentric rollers and those of the eccentric rollers.

Fig. 71

- In the case of configuration with more than five rollers, only eccentric pins should be adjusted. In this case, all eccentric rollers will be aligned and equally offset from the midpoint line of the concentric rollers.

> Anticorrosion treatments

TEN, TEP, UEN, UEP guides

Treatment	Characteristics
Rollon-Nox	Patented high depth nitride hardening and black oxidation treatment that provides good durability under high loads or frequencies and good corrosion resistance. It is standard for all sizes.
Rollon E-coating (K)	As Rollon-Nox version with additional electro painting that provides a fine black finishing to the entire rail. It can be partially removed from the raceways on the running contact point of the rollers after a period of use. Rails with Rollon E-Coating are supplied with stainless steel rollers to further increase the corrosion resistance.

Tab. 53

TES, UES guides

Treatment	Characteristics
Zinc Plating ISO 2081	Standard plating on TES, UES rails and sliders. Ideal for indoor applications. Zinc plated sliders are supplied with steel rollers.
Rollon E-coating (K)	As zinc-plated ISO 2081 version with additional electro painting that provides a fine black finishing to the entire rail. It can be partially removed from the raceways on the running contact point of the rollers after a period of use. Rails with Rollon E-Coating are supplied with stainless steel rollers to further increase the corrosion resistance.

Tab. 54

TEX, UEX guides

As standard, rails are made of in AISI316L with rollers in hardened AISI440.

Treatment	Characteristics
Electro-polish (X)	Rails are completely electro-polished for further improved corrosion resistance. The electro-polishing treatment also gives the product a very shiny surface.

Easyslide

Product explanation

- > Easyslide is a linear ball rail system (with caged ball bearings for the SN series or with recirculating ball bearings for the SNK series) with single or multiple sliders.

Fig. 1

The Easyslide series is a system of drawn steel linear rails with induction hardened raceways. The system consists of an "C" shaped linear profile rail, and one or more internal sliders with caged recirculating ball bearings.

The most important characteristics:

- Guide rails and sliders of SN series are made of cold-drawn bearing steel
- Ball cage is made of steel for the SN series
- Balls are made of hardened bearing steel
- Raceways of the guide rails and sliders are induction hardened (ground for the SNK series)
- Long service life
- With recirculating ball bearings for the SNK series

Preferred areas of application of the Easyslide product family:

- Transportation industry (e.g., exterior and interior rail and bus doors, seat adjustments, interior)
- Construction and machine technology (e.g., housings, protective covers)
- Medical technology (e.g., X-ray equipment, medical tables)
- Automotive technology
- Logistics (e.g., handling units)
- Packaging machines (e.g., beverage industry)
- Special machines

SN linear bearing, version 1, with single slider

This linear bearing consists of a guide rail and a slider that runs within the ball cage in the guide rail. High load capacities, compact cross-sections and simple and easy mounting characterize this series.

Fig. 2

SN linear bearing, version 2, with multiple independent sliders

Variant with several sliders, which each runs in its own ball cage, independent of each other, in the guide rail. Slider length and stroke for each slider can be different within one rail.

Fig. 3

SN linear bearing, version 3, with multiple synchronized sliders

Several sliders run in a common ball cage within the guide rails. The slider lengths can vary here as well and then form a total unit, which implements the corresponding stroke.

Fig. 4

SNK series linear rails with recirculating ball bearings.

The SNK series consists of a drawn steel C profile rail with hardened and ground raceways and of an internal slider with a recirculating ball bearing system. This product is extremely compact and boasts high load rating and great sliding properties.

Fig. 5

Technical data

Fig. 6

Performance characteristics:

- Available sizes for SN: 22, 28, 35, 43, 63
- Sections available for the SNK series: 43
- Inductive raceways hardened and ground for the SNK series
- Rails and sliders are made of cold-drawn bearing steel
- Balls are made of hardened bearing steel
- Max. operating speed 1.5 m/s (SNK)
- Temperature range: from -20 °C to +170 °C for the SN series
from -20° to 70° for the SNK series
- Electrolytic zinc-plating as per ISO 2081; increased anticorrosive protection on request (see Chapter 4, Technical instructions, pg. 16 Anticorrosive protection)
- Linear accuracy 0.1 mm/m stroke
- 2 different types of preload

Remarks:

- SN can only be horizontally mounted, high performance SNK can be horizontally and vertically mounted.
- External stops are recommended
- Fixing screws of property class 10.9 must be used for all linear bearings

* For systems of versions 2 in size 63 with two independent sliders, the K dimension changes from 80 mm to 110 mm and for each additional slider by another 30 mm

Tab. 10

Version 2 with multiple independent sliders

For systems of versions 2 in size 63 with two independent sliders, the K dimension changes from 80 mm to 110 mm and for each additional slider by another 30 mm

Fig. 8

Version 2 is a variant of version 1 with several independent sliders. The total load capacity is based on the number of sliders in the rail and on their lengths. The length and stroke of the individual sliders can be different.

To ensure that all fixing holes of the rail are accessible, S must be $< L/2 - K$.

To ensure proper smooth movement it is necessary that $H \leq 7S$.

Version 3 with multiple synchronized sliders

Fig. 9

Version 3 is a variant of version 1 with several synchronized sliders. The total load capacity is based on the number of sliders in the rail. The length of the individual sliders can therefore vary. To ensure that all fixing holes of the rail are accessible, S must be $< L/2 - K$.

To ensure proper smooth movement it is necessary that $H \leq 7S$.

Tab. 14

Technical instructions

> Static load

The maximum static loads of the Easyslide series are based on the slider length and are listed in the tables of the previous pages. These load capacities are valid for a loading point of forces and moments in the center of the slider (for off-center loading, see ES-13). The load capacities are independent of the position of the slider inside the rails. During the static tests the radial load capacity, C_{Orad} , the axial load capacity, C_{Oax} , and

moments M_x , M_y and M_z indicate the maximum permissible values of the loads. Higher loads negatively affect the running properties and the total mechanical strength may be compromised. A safety factor, S_0 , is used to verify the static load, which takes into account the basic parameters of the application and is defined in more detail in the following table:

Safety factor S_0

Neither shocks nor vibrations, smooth and low-frequency reverse, high assembly accuracy, no elastic deformations	1 - 1.5
Normal installation conditions	1.5 - 2
Shocks and vibrations, high-frequency reverse, significant elastic deformation	2 - 3.5

Tab. 15

The ratio of the actual load to maximum permissible load may be as large as the reciprocal of the accepted safety factor, S_0 , at the most.

$$\frac{P_{Orad}}{C_{Orad}} \leq \frac{1}{S_0}$$

$$\frac{P_{Oax}}{C_{Oax}} \leq \frac{1}{S_0}$$

$$\frac{M_1}{M_x} \leq \frac{1}{S_0}$$

$$\frac{M_2}{M_y} \leq \frac{1}{S_0}$$

$$\frac{M_3}{M_z} \leq \frac{1}{S_0}$$

Fig. 13

The formulas above apply for a single load case. If there are two or more of the described forces simultaneously, the following check must be made:

$$\frac{P_{Orad}}{C_{Orad}} + \frac{P_{Oax}}{C_{Oax}} + \frac{M_1}{M_x} + \frac{M_2}{M_y} + \frac{M_3}{M_z} \leq \frac{1}{S_0}$$

P_{Orad} = effective radial load
 C_{Orad} = permissible radial load
 P_{Oax} = effective axial load
 C_{Oax} = permissible axial load
 M_1 = effective moment in the x-direction
 M_x = permissible moment in the x-direction
 M_2 = effective moment in the y-direction
 M_y = permissible moment in the y-direction
 M_3 = effective moment in the z-direction
 M_z = permissible moment in the z-direction

Fig. 14

Off-center load P of the slider (SN series):

For an off-center load of the slider, the different load distribution on the balls must be accounted for with a reduction of the load capacity C. As shown in the diagram to the right, this reduction of the distance, d, from the loading point is dependent on the slider center. The value, q, is the position factor, the distance, d, is expressed in fractions of slider length S. The permissible load, P, decreases as follows:

$$P = q \cdot C_{Orad}$$

for a radial load

$$P = q \cdot C_{Oax}$$

for an axial load

Fig. 15

For the static load and the service life calculation, P_{Orad} and P_{Oax} must be replaced by the equivalent values calculated as follows (see fig. 16):

$$P_{Orad} = \frac{P}{q}$$

if the external load, P, acts radially

$$P_{Oax} = \frac{P}{q}$$

if the external load, P, acts axially

Fig. 16

Fig. 17

Fig. 18

> Service life

The service life of a linear bearing depends on several factors, such as effective load, operating speed, installation precision, occurring impacts and vibrations, operating temperature, ambient conditions and lubrication.

The service life is defined as the time span between initial operation and the first fatigue or wear indications on the raceways.

In practice, the end of the service life must be defined as the time of bearing decommissioning due to its destruction or extreme wear of a component.

This is taken into account by an application coefficient (f_i in the formula below), so the service life consists of:

Series SN

$$L_{km} = 100 \cdot \left(\frac{C}{W} \cdot \frac{1}{f_i} \right)^3$$

L_{km} = calculated service life (km)
 C = dynamic load capacity (N) = C_{0rad}
 W = equivalent load (N)
 f_i = application coefficient (see tab. 17)

Fig. 19

Series SNK

$$L_{km} = 100 \cdot \left(\frac{C}{W} \cdot \frac{f_c}{f_i} \cdot f_h \right)^3$$

L_{km} = theoretical service life (km)
 C = dynamic load capacity (N) = C_{0rad}
 W = effective equivalent load (N)
 f_c = contact factor
 f_i = application coefficient
 f_h = stroke factor

Fig. 20

The stroke factor f_h takes into account the higher load of the raceways and rollers during short strokes on the same total length of run. The corresponding values are taken from the following graph (for strokes longer than 1 m, $f_h = 1$):

Number of sliders	1	2	3	4
f_c	1	0.8	0.7	0.63

Tab. 16

Fig. 21

Application coefficient f_i

Neither impacts nor vibrations, smooth and low-frequency direction change, clean operating conditions, low speed (<0.5 m/s)	1 - 1.5
Slight vibrations, average speeds (between 0.5 and 0.7 m/s) and average direction change	1.5 - 2
Impacts and vibrations, high-frequency direction change, high speeds (>0.7 m/s), very dirty environment	2 - 3.5

Tab. 17

If the external load, P , is the same as the dynamic load capacity, C_{0rad} , (which must never be exceeded), the service life at ideal operating conditions ($f_i = 1$) amounts to 100 km. Naturally, for a single load P , the following applies: $W = P$. If several external loads occur simultaneously, the equivalent load is calculated as follows:

$$W = P_{rad} + \left(\frac{P_{ax}}{C_{0ax}} + \frac{M_1}{M_x} + \frac{M_2}{M_y} + \frac{M_3}{M_z} \right) \cdot C_{0rad}$$

Fig. 22

> Clearance and preload

The linear ball bearings of the SN and SNK series are mounted as standard with no play. For more information, please contact Rollon technical support.

Preload classes		
Increased clearance	Light clearance	Increased preload
G ₁	Standard	K ₁

Tab. 18

* for higher preload, contact Rollon technical support.

> Coefficient of friction

With correct lubrication and installation on level and rigid surfaces and sufficient parallelism for rail pairs, the friction value is less than or equal to 0.01. This value can vary depending on the installation situation (see pg. ES-19, Instructions for use). For the SNK series, the coefficient of friction is equal to or less than 0.06.

> Linear accuracy

With installation of the rails using all bolts on a perfectly plane support surface with the fixing holes in a straight line, the linear accuracy of the sliders to an external reference results from the following equation:

$$\boxed{//} = \frac{\sqrt{H}}{300} \text{ (mm)}$$

H = Stroke

Fig. 23

> Speed

The linear bearings of the SN series can be used up to an operating speed of 0.8 m/s (31.5 in/s). With high-frequency direction changes and the resulting high accelerations, as well as with long ball cages, there is a risk of cage creep (see pg. ES-19, Instructions for use). The SNK series rails, on the other hand, reach a maximum speed of 1.5 m/s, and there is no risk of cage creep.

> Temperature

The SN series can be used in ambient temperatures from -20 °C to +170 °C (-4 °F to +338 °F). The SNK series can be used at ambient temperatures between -20 °C and + 70 °C. A lithium lubricant for high operating temperatures is recommended for temperatures above +130 °C (+266 °F).

> Anticorrosive protection

- The SN series standard anticorrosive protection is electrolytic zinc plating in accordance with ISO 2081. If increased anticorrosive protection is required, chemically nickel plated rails and stainless steel ball bearings are available.
- Numerous application-specific surface treatments are available upon request, e.g., FDA-approved nickel plating for use in the food industry. For more information, please contact Rollon technical support.

> Lubrication SN

Recommended lubrication intervals are heavily dependent upon the ambient conditions. Under normal conditions, lubrication is recommended after 100 km operational performance or after an operating period of 6 months. In critical application cases the interval should be shorter. Please clean the raceways carefully before lubrication. Raceways and spaces of the ball cage are lubricated with a lithium lubricant of average consistency (roller bearing lubricant).

Different lubricants are available on request for special applications:

- FDA-approved lubricant for use in the food industry
- specific lubricant for clean rooms

- specific lubricant for the marine technology sector
 - specific lubricant for high and low temperatures
- For specific information, contact Rollon technical support.

Under normal conditions, correct lubrication:

- reduces friction
- reduces wear
- reduces stress on contact surfaces due to elastic deformation
- reduces noise during operation
- increases the regularity of the rolling movement

> Lubrication SNK

Lubrication when using N-sliders SNK43

The SNK43 sliders are fitted with a self lubricating kit provided to periodically lubricate the slider.

This provides a progressive release of lubricant (see tab. 19) on the raceway during operation of the slider. The expected service life is up to 2 million cycles, depending on the type of application. The zerk fittings (see fig. 24) provide the lubrication.

Different lubricants are available on request for special applications:

- FDA-approved lubricant for use in the food industry
- specific lubricant for clean rooms
- specific lubricant for the marine technology sector
- specific lubricant for high and low temperatures

For specific information, contact Rollon technical support.

Lubricant	Thickening agent	Temperature range [°C]	Kinematic viscosity 40°C [mm²/s]
Mineral oil	Lithium soap	-30... to +120	approx 110
Roller bearing lubricant	Lithium soap	-30 to +170	approx 160

Tab. 19

Grease applicator M6x1 DIN 3405 compliant

Fig. 24

> Fixing screws

Fig. 25

The rails of the SN series in sizes 22 to 43 mm are fixed with countersunk head screws according to DIN 7991.

The SNK43 series rails are fastened with countersunk head screws according to DIN 7991 or with Torx® head screws (special design, see fig. 25).

The Torx® screws for the rails variant TSC are included.

Size	Screw type	d	D [mm]	L [mm]	K [mm]	S	Tightening torque
63	M8 x 20	M8 x 1.25	13	20	5	T40	34,7
SNK43	M8 x 16	M8 x 1,25	16	16	3	T40	22

Tab. 20

Recommended Standard fixing screw tightening torques

Property class	Size	Tightening torque [Nm]
10.9	22	3
	28	6
	35	10
	43	25
	63	30

Tab. 21

A support of the rail sides is not strictly necessary, but it helps reduce stress on the screws and increases rigidity.

Rail Bracket

Fig. 26

A support is advisable if the safety coefficient of the application is equal to or lower than 1.5.

> Installation instructions

- The internal stops on the SN series are used to stop the unloaded slider and the ball cage. Please use external stops as end stops for a loaded system.
- Prepare a sufficient bevel on the threaded fixing holes, according to the following table:
- To achieve optimum running properties, high service life and rigidity, it is necessary to fix the linear bearings with all accessible holes on a rigid and level surface.

Size	Bevel (mm)
22	0,5 x 45°
28	1 x 45°
35	1 x 45°
43	1 x 45°
63	1 x 45°

Tab. 22

Fig. 27

> SNK Joined Rails

If long guide rails are required, two or more rails can be joined to the desired length. When putting guide rails together, be sure that the register marks shown in fig. 28 are positioned correctly.

These are fabricated asymmetric for parallel application of joined guide rails, unless otherwise specified.

Fig. 28

General information

The maximum available rail length in one piece is indicated in table 13 on page ES-10. Longer lengths are achieved by joining two or more rails (joined rails).

Rollon machines the rail ends at a right angle to the impact surfaces and marks them. Additional fixing screws are included with the delivery, which ensure a problem-free transition of the slider over the joints, if the following installation procedures are followed. Two additional threaded holes are required in the load-bearing structure. The included end fixing screws correspond to the installation screws for the rails for cylindrical counterbores. The alignment fixture for aligning the rail joint can be ordered using the designation given in the table (tab. 23).

Fig. 29

TSC/TSV	11	M8	see pg. ES-17	16	AT43

Tab. 23

> SN instructions for use

- For linear bearings of the SN series, the sliders are guided through a ball cage inside the rails. When the sliders run their course relative to the rails, the ball cage moves along for half the slider stroke. The stroke ends as soon as the slider reaches the end of the cage.
Normally the cage moves synchronously to the balls at half the speed of the slider. Any occurring cage slip affects the synchronous movement of the ball cage negatively, causing it to reach the internal stops prematurely (cage creep). This reduces the stroke. However, the stroke value can be normalized at any time by moving the slider to the stop in the stopped cage. This moving of the slider relative to the cage will have increased resistance, which is dependent on the working load.
- The causes of cage creep can be installation accuracy, dynamics, and load changes. The effects can be minimized by observing the following advice:
 - The stroke should always remain constant and come as close as possible to the nominal stroke of the linear bearing.
 - For applications with various strokes, make sure that the drive is sufficiently dimensioned to guarantee a movement of the slider relative to the cage. A coefficient of friction of 0.1 should be calculated for this.
 - Another possibility is to include a maximum stroke without load in the working cycle in order to resynchronize the slider and ball cage.
 Parallelism errors or inaccuracies in the installation or in the mounting surfaces of mounted pairs can influence the cage creep.
- Series SN linear bearings should only be used for horizontal movement.

Fig. 30

If the bearing cage covers one or more fixing holes for the rail, access holes are made in the cage. The number and position of the holes can vary in different supplies.

Access to all fixing screws of the rail is guaranteed in all cases by positioning the cage aligned with the holes.

SNK instructions for use

- SNK: Always handle the slider out of the rail by its plastic retainer to prevent ball bearings from escaping.

Curviline

Product explanation

> Curviline are curvilinear rails for constant and variable radii

Fig. 1

Curviline is the name of the curvilinear rail product family that is used for all non-linear special movements. Rails with constant or variable radii may be specified according to customer requirements, resulting in a highly flexible, economical solution. Curviline is available in two rail widths.

The use of standard radii is recommended. All non-standard rail layouts and radii are possible as custom products, however extra lead time may result.

Preferred areas of application of the Curviline product family:

- Packaging machines
- Railway car interior doors
- Special extensions
- Shipbuilding (interior doors)
- Food industry

The most important characteristics:

- Straight and curved sections in one continuous rail is possible
- Sliders with four rollers arranged in pairs maintain the preload over the entire rail length
- Custom production according to customer requirements
- Also available in stainless steel

Constant radii

The layout of CKR guide rails corresponds to a partial section of a complete circle.

Fig. 2

Variable radii

CVR curvilinear rail is a combination of variable radii and straight sections.

Fig. 3

Straight rail

The linear rail Curviline is also available in its straight version.

Fig. 4

Slider

The carriage maintains the desired preload over the entire rail layout. Pivoting roller mounts coupled with concentric and eccentric rollers allows for a smooth operation over complex rail layouts.

Fig. 5

Technical data

Fig. 6

Performance characteristics:

- Available rail widths: CKR01/CVR01: 16.5 mm (0.65 in) and CKR05/CVR05: 23 mm (0.91 in)
- Max. slider operating speed on the rail: 1.5 m/s (59 in/s) (depending on application)
- Max. acceleration: 2 m/s² (78 in/s²) (depending on application)
- Max. effective length of the rail: 3,240 mm (127.56 in)
- Max. traverse: CCT08: 3,170 mm (124.8 in) and CCT11: 3,140 mm (123.62 in)
- Minimum radius for stainless steel version and non-hardened version 120 mm
- Minimum radius for version with tempered raceways: 300 mm for section 01, 400 mm for size 05
For non-standard radii, please contact Rollon technical support.
- Radius tolerance +/- 0.5 mm (0.02 in), angle tolerance +/- 1°
- Temperature range: -20 °C to +80 °C (-4 °F to +176 °F)
- Rail and runner electrolytic zinc-plated and passivated (Rollon Alloy); increased anticorrosive protection on request (see pg. CL-12 Anticorrosive protection)
- Rail material: C43, AISI316L for the stainless steel version
- Slider body material: Fe360, AISI316L for the stainless steel version
- Radial ball bearing roller material: 100Cr6, AISI440 for the stainless steel version
- Rollers are lubricated for life

Remarks:

- With a simple adjustment of the eccentric roller (denoted with a marking on the bottom of the roller), the slider preload can be set to desired preload, including clearance.
- The recommended hole pitch is 80 mm (3.15 in) on the extended length
- Please indicate the precise rail layout and the desired hole pattern in a drawing
- Indicate if the design is a right or left version when ordering
- Joints are possible in straight sections. For more information, please contact Rollon technical support.
- Resulting moment loads must be absorbed through the use of two sliders. For more information, please contact Rollon technical support.

Product dimensions

✓

> Rails with constant/variable radii with tempered raceways

Fig. 7

¹ The max. angle (X) is dependent on the radius
² For curved linear rails with variable radius, there must always be a straight section (Y) between two successive curved sections. Refer to tab.18 on pag. CL-15 to define the minimum length required for the straight section (Y).

Fig. 8

Technical instructions

> Slider with joint

In applications involving the simultaneous use of two sliders connected to the same mobile element and along a curved guide with variable radius, or combined straight and curved sections in the same guide, a joint between the sliders and the mobile element is necessary to avoid jamming of the sliders in the areas of changing curvature. Alternatively, Rollon can supply, for each type of slider in the catalog, a special version with an oscillating plate that enables the joint, guaranteeing optimal movement and eliminating the need to build the joint on the moving structure.

Fig. 27

> Anticorrosive protection

The Curvine product family comes standard with electrolytic zinc plating with passivation for anticorrosion protection. If increased anticorrosive protection is required, application-specific surface treatments are available on request, e.g. as nickel-plated design with FDA approval for use in the food industry. Rails of Curvine series are available also in stainless

steel (rails CKRX, CVRX), with the sliders in stainless steel CCTX08 and CCTX11 (page CL-10/11). All other sliders have a standard surface treatment of zinc plating with passivation and, on request, can be supplied with increased anticorrosion protection (zinc-nickel or nickel plating) with rollers in stainless steel (AISI 440).

> Lubrication

Roller lubrication

All rollers of the Curviline product family are lubricated for life.

Lubrication of the raceways

Rails must be lubricated before operation. Recommended lubrication intervals are heavily dependent upon the ambient conditions, speed and temperature. Under normal conditions, lubrication is recommended after 100 km operational performance or after an operating period of six months. In critical application cases the interval should be shorter. Please clean the raceways carefully before lubrication.

We recommend a roller bearing lubricant with a lithium base of average consistency.

Proper lubrication during normal conditions:

- reduces friction
- reduces wear
- reduces the load of the contact surfaces through elastic deformations
- reduces running noise

Different lubricants are available by request for special applications:

- FDA-approved lubricant for use in the food industry
- specific lubricant for clean rooms
- specific lubricant for the marine technology sector
- specific lubricant for high and low temperatures

For specific information, contact Rollon technical support.

> Setting the preload

Fig. 28

If the curvilinear rails are delivered as a system, the sliders are already set with no clearance. In this case the fixing screws are secured with Loctite® at the factory.

If delivered separately, or if the sliders should be installed in another track, the eccentric roller pins must be readjusted. Important: The fixing screws must be additionally glued against loosening. The following points must also be observed:

- Wipe the raceways of any dirt and debris.
- Slightly loosen the fixing screws of the roller mounting.
The eccentric roller pins are marked on the bottom.
- Position the slider(s) at the ends of the rail.
- The special flat key provided is inserted from the side onto the hexagonal of the roller to be set (see fig. 28).

Type	Tightening torque [Nm]
CCT08	7
CCT11	12

Tab. 17

- By turning the flat key clockwise the roller is pressed against the raceway and thus reduces the clearance. Observe that with increasing preload, the friction is also increased and thus the service life reduced.
- Hold the roller pin with the adjustment key in the desired position and carefully tighten the fixing screw. The exact tightening torque will be checked later.
- Move the slider on the rail and check the preload over the entire length of the rail. It should move easily and the slider should not have play at any location of the rail.
- Now tighten the fixing screws with the specified tightening torque (see tab. 17), while the flat key holds the angle adjustment of the pin. A special thread in the roller pin secures the set position.

0-Rail

Product explanation

> O-Rail - unique assembly possibilities

Fig. 1

The roller linear system O-Rail offers the maximum flexibility configuration due to the original shape of the guide with 3 raceways arranged at 90 ° to each other where on each of those can slide rollers R..G43 series. Using a single guide, two, or more parallel guides, gives rise to a number of combinations capable of satisfying each specific need for linear motion and offering exceptional self-alignment capacity. O-Rail is constructed in high strength steel hardened with hardening treatments, for a further improvement of both performance and durability.

O-Rail is designed to be a strong and simple multitask linear system for larger handling and automation applications. It is an easy to assemble system, that offers smooth motion even on inaccurate surfaces.

> FXRG series

Fig. 2

Fig. 3

Fig. 4

General characteristics

New geometrical design of the contact areas, based on Gothic arch raceways

- Superior sliding
- Very low friction
- Long lifetime
- Greater load capacity
- Very compact design

New rollers, double row bearings, with increased thickness of outer ring, gothic profile and finished raceways.

- Increased load capacity
- Increased lifetime
- Extremely low noise
- High speed
- Neoprene lateral seals for dust protection

Self-aligning system when using two parallel rails, compensating large assembly inaccuracies on both longitudinal and transversal plane.

- allow for installation on non precise structures - welded carpentry or aluminium frame structures
 - Do not require machined fixing surfaces for installation.
- Cost saving, as easy and fast assembly

Patented process Rollon-Nox, to further improve the rail material and thermochemical hardening treatment of deep nitriding and post-oxidation black for an effective corrosion protection.

- Very high hardness
- Resistance to heavy loads
- Very low wear
- Effective corrosion protection
- Smooth black finish

Fig. 5

> Configurations

The FXRG allows a wide range of configurations when using two or more rails in parallel. Depending on required load and moment capacities/direction more single rollers and standard sliders are used to obtain

unique Self-aligning systems. Contact ROLLON for eventual support in dimensioning customized systems .

Dimensions and load capacity

> FXRG series

FXRG is a high precision cold drawn profile of high strength steel. After a high depth nitride hardening treatment the rails are oxidized, assuring high hardness and excellent corrosion resistance. The characteristic black color on the whole rail is the result of oxidation and subsequent process

of micro-impregnation with oils and substances for improved smoothness and long life. The fixing holes are for standard M6 cylindrical low head screws, DIN 7984, with 80mm pitch.

Tab. 7

Self-aligning combinations

When FXRG rails are used in parallel, the use of floating rollers R.PG43 and guiding rollers R.VG43 provides a Self-aligning system, capable of compensating greater inaccuracies of structure or assembly errors. The guiding rollers R.VG43 in contact with the FXRG's gothic raceways assure

precise guiding while compensating misalignment, as they are able to rotate slightly around the longitudinal axis of about $\pm 5^\circ$. Combined with floating rollers R.PG43 on a parallel rail, such system can compensate an axial displacement of $\pm 1 \text{ mm}$, in addition to a max. rotation of $\pm 5^\circ$.

Fig. 18

Fig. 19

Technical instructions

> Mounting configurations

The concentric rollers should be positioned in the direction of radial loading. Warning! A single slider configuration will rotate $\pm 5^\circ$ around the longitudinal axis of a single FXRG rail, not able to take any Mx moments.

Single rail with 3 rollers slider

Fig. 20

It is recommended, when more than two rollers are on the same track with max. radial load, to use only two concentric rollers (as from example figure). The others should be eccentric. For cases with a wider distance between concentric rollers, please contact ROLLON's Technical department for dimensioning.

Single rail with 5 rollers slider

Fig. 21

Double rail with slider for high overturning moments

Fig. 22
OR-9

The rollers need to be positioned on the rail in numbers and directions according to the prevailing load. It is always preferable to orient the rollers so that the prevailing load acts radially, due to higher radial load capacity.

Fig. 23

The rollers must be fixed on a metal surface not yielding, perfectly flat and with its fixing screws, applying a locking torque of 22 Nm.

The tightening of the fixing-screw is to be performed, while holding the roller firm with an Allen-wrench, present on the opposite side of the fixing thread. In case eccentric rollers, it is advisable to use a cup-spring washer under the screw-head to obtain a firm movement, able to maintain the roller "firm" against the surface and facilitate minor

adjustment of eccentric roller, before the final locking. The preload adjustment can also be carried out by checking the force F_i of insertion of the movable part, in which the rollers are fixed into the rail. In general for a good F_i adjustment, the inserting friction must be between 2-10 N. To increase or decrease the F_i act on eccentric rollers, opposite to the load direction (see figure below).

Fig. 24

In case required to have eccentric rollers on the internal rail side, it is necessary to include optional accesses, code FXRG-....C, to allow Allen-key to reach the roller. Otherwise the adjustment can take place outside of the rail.

Possible configurations

Fig. 25

> Lubrication

Roller pin lubrication

Recommended lubrication intervals are heavily dependent upon the ambient conditions. Under normal conditions, lubrication is recommended after 100 km operational performance or after an operating period of 6 months.

In critical application cases the interval should be shorter. Please clean the raceways carefully before lubrication. We recommend a roller bearing lubricant with a lithium base of average consistency.

Lubrication of the raceways

To reach the calculated service life, a film of lubricant should always be present between the raceway and roller, this also serves to protect against corrosion of the ground raceways.

Proper lubrication during normal conditions:

- reduces friction
- reduces wear
- reduces the load of the contact surfaces through elastic deformations
- reduces running noise

> Joined Rails

If long guide rails are required, two or more rails can be joined to the desired length. When putting guide rails together, be sure that the register marks shown in fig. 26 are positioned correctly.

These are fabricated asymmetric for parallel application of joined guide rails, unless otherwise specified.

Fig. 26

General information

The maximum available rail length in one piece is indicated in table 4 on page OR-6. Longer lengths are achieved by joining two or more rails (joined rails).

Rollon then machines the rail ends at a right angle to the impact surfaces and marks them. Two additional threaded holes (see fig. 27) are required in the load-bearing structure. To ensure a problem-free transition of the slider over the joints, please follow the installation procedures next page.

For information about the structure holes, the additional screws required and the alignment fixture for aligning the rail joint, please see table 7 below.

Fig. 27

Rail type	A [mm]	Threaded hole (load-bearing structure)	Screw type	Alignment fixture
FXRG	10	M6	M6 DIN 7984	ATFXR

Tab. 8

> Installation of joined rails

After the fixing holes for the rails are made in the load-bearing structure, the joined rails can be installed according to the following procedure:

- (1) Fix the individual rails on the mounting surface by tightening all screws except for each last one on the rail joint.
- (2) Install the end fixing screws without tightening them (see fig. 28).

Fig. 28

- (3) Place the alignment fixture on the rail joint and tighten both set screws uniformly, until the raceways are aligned (see fig. 29).
- (4) After the previous step (3) it must be checked if both rail backs lie evenly on the mounting surface. If a gap has formed there, this must be shimmed.

Fig. 29

- (5) The bottom of the rails should be supported in the area of the transition. Here a possible existing gap must be looked for, which must be closed if necessary for correct support of the rail ends by shims.
- (6) Insert the key through the holes in the alignment fixture and tighten the screws on the rail ends.
- (7) Remove the alignment fixture from the rail.

Prismatic Rail

Product explanation

> Prismatic Rail: with cylindrical or V-shaped rollers

Fig. 1

The Prismatic Rail product family is composed of roller sliders sliding on V-shaped rails made of hardened steel. These linear guides also have high self-alignment properties.

V-shaped rails are induction hardened and polished, available in three sizes: 28, 35 and 55 mm. Rails can be machined with two straight cuts, one straight and one slanting cut or two slanting cuts. These options allow to create joinable versions, and thus obtaining longer strokes.

The aluminium slider can be configured with a variable number of rollers with steel pins, ranging from 3 to 6. Rollers are in turn available in two variants, cylindrical or V-shaped, with variable diameter from Ø30 a Ø62 depending on rail size.

Preferred areas of application:

- Robot and handling systems
- Industrial automation
- Logistics
- Packaging machines

The most important characteristics:

- Long life thanks to hardened raceways
- Optimal reliability in dirty environments
- Self-aligning system
- Simple mounting
- High dynamics

Drilled guide rails with straight cut:

Machining provided for guide rails with no joint.

Fig. 2

Drilled guide rails with one straight and one slanting cut:

Fig. 7

Technical data

Fig. 8

Performance characteristics:

- Sizes available: 28,35 and 55 mm.
- Rollers dimensions: Ø30 - Ø40 - Ø52 - Ø62.
- V-shaped rollers in hardened C45 steel available for sizes 28 and 35.
- Aluminum sliders, floating and fixed, with 3, 4 or 6 rollers.
- Max. speed: 7 m/s (depending on application).
- Max. acceleration: 20 m/s² (depending on application).
- Max. radial load capacity: 15000 (per slider).
- Max. axial load capacity: 15000 (per slider).
- Operating temperature: from -10°C to +80°C.
- Induction hardened and polished rails.
- Max. rail length: 4100 mm.
- Steel assembly pins.

Notes:

- Longer stroke achievable with joinable versions.
- V-shaped rails available in drilled or non-drilled versions.
- Please follow the diagrams in every slider section to ensure correct assembly.
- For applications with high projecting loads, the sliders' rollers must be adjusted so that the load is supported by the maximum possible number of them.

					Length	
					J = jointed rails (only when required)	
					Size	
Linear guides series Prismatic Rail						

Ordering example: P55-2750FX, P55-2600FXX, P55-J5200FC01

Notes on ordering: the rail length codes are always 4 digits; use zeroes as a prefix when lengths are shorter.

In case of jointed rails it is necessary to send the segmentation order.

> Assembly of standard carriages / K version carriages

IMPORTANT: for applications with high projecting loads, the rollers of the slides must be adjusted so that the load is supported by the maximum possible number of rollers. If this means arranging the rollers symmetrically with respect to the standard roller slide version, please add the letter K at the end of the code when filling in the order form. However, the roller assembly can also be inverted at a later date, by disassembling the pins and rollers and then reassembling them in the opposite way.

ROLLON®
BY TIMKEN

Speedy Rail

Product explanation

> Self-supporting and self-aligning extruded aluminum linear guides

Fig. 1

Speedy Rail® beam is a heat-treated aluminium alloy profile with hollow cross-sections which makes it very strong under torsion and deflection stresses. Beams are then subject to a special patented treatment which provides a smooth, hard (700 HV) surface comparable to tempered steel. The fusion point of the non-stick surface layer (2100°C) permits an excellent resistance to welding splatters.

For these reasons the **Speedy Rail®** beams and components are widely used in the automotive industry to build transfer systems (lift & carry) for automated welding lines.

Speedy Rail® linear motion systems are lightweight, self-supporting, easy to assemble, inexpensive, modular, clean, quiet and ex stock. **Speedy Rail®** assemblies are very simple. Standard bolted dovetails and fishplate clamps are used for end to end joining. Rails are available in single beam up to max length 7.5 meters – 24.6 feet – and can be joined end-to-end with dovetails to build a transfer system of unlimited length. Rails have a dovetail groove on each side to accommodate any fixture. In this way it is not necessary to drill or to weld. The profiles Wide Body SR 180, Super Wide Body SR 250 are equipped with grooves and have a planarity precision so that guideways can be fixed without any mechanical machining.

The most important characteristics:

- Standard modular components
- All parts reusable
- Minimum space required
- Narrow profile
- Hard surface
- Resistance to welding splatters
- Quiet smooth operations
- Resistance to high corrosion
- Saving in assembly time
- Strong, lightweight
- Savings in reducing drive size
- Only hand tools required to assemble or modify

Preferred areas of application:

- Automotive assembly
- Woodworking and furniture
- Glass processing
- Painting lines
- Food industry
- Sheet working and laser cut machines
- Plastic extrusion, machine tools
- Appliances assembly and production
- Cardboard handling machines
- Packaging
- Tiles, shingles production
- Welding lines

Technical data

> Dimensions

Fig. 2

Speedy Rail® guides are available in the following sizes:

Type	h [mm]	w [mm]
Speedy Rail 35	35	14
Speedy Rail C 48	48	28
Speedy Rail Mini	60	20
Speedy Rail Middle	90	30
Speedy Rail Standard	120	40
Speedy Rail Wide Body	180	60
Speedy Rail Super Wide Body	250	80

Tab. 1

> Rollers and roller assemblies:

The **Speedy Rail®** range includes a large selection of rollers both cylindrical and “V” shaped and roller assemblies with two or more rollers. Our rollers are covered by a sintered plastic compound, resistant to pollutants and virtually maintenance-free. Ball and/or needle bearings with high performance are mounted into the rollers and can be maintained either with standard greasing procedure or lifetime lubricated. All roller boxes are equipped with concentric and eccentric pins for a quick adjustment of the contact between rollers and rail.

- **Standard**
with 2 rollers, 1 concentric and 1 eccentric
- **Blindo Beam®**
with 4 or 8 rollers. It provides 3 mounting surfaces
- **Compact**
with 2 rollers. Suitable for low clearances and limited operation room
- **Floating**
with 4, 6 or even more rollers. Suitable for the withstanding minor misalignments on the rail mounted in pairs, one concentric and one eccentric
- **“V” roller support**
This kind of support are suggested for light applications and constricted operation areas

Supports are mounted on the frame when the rail is movable and on the trolleys when it is fixed. By the calculation of system needs, consider the max. radial load applicable to the rollers in accordance with the description of each roller.

> 8 Rollers floating assembly - complete pairing

* Lubricator nipple mounted for periodic lubrication versions only

Fig. 146

Notes:

The complete pairing kit comes with one eccentric and one concentric roller assembly mounted on a backing plate. The concentric roller assembly should take the heavier load. For trolley on 2 parallel guides use on one guide axially free roller assemblies ($\pm 4\text{mm}$).

Pairing kits are available with two roller assemblies having the same number of rollers. For different combinations (i.e. upper assembly with 6 rollers and lower assembly with 4 rollers, two eccentric rollers assemblies) please order the assemblies separately, without baseplate and add the backing plate shown in this page. However we suggest to verify always with our technical department prior to ordering.

Tab. 22

> Rollers

Speedy Rail system

Rollers are manufactured with a steel shaft, high quality ball-needle bearings, rubber seals labyrinth.

The external surface of the roller is machined with a slightly convex profile, finished with a sintered plastic compound having the following properties:

Tensile strength:	85 N/mm ²
Rockwell hardness:	120 R
Melting point:	+ 220 °C
Max. continuous working temperature:	+80°C
Min. continuous working temperature:	- 20°C

Chemical resistance: excellent to mineral and organic oils; good to basic solutions; fairly good to acid solutions.

We always recommend a preliminary test for the rollers in the actual working environment.

> Roller assemblies

Roller assemblies with four (4) rollers have the two inner rollers mounted on a plain, concentric sleeve while the outer ones have an eccentric sleeve. This setup allows the proper adjustments to compensate dimensional tolerances on the rail. Two roller assemblies have one roller with an eccentric sleeve and the other with a concentric setup.

Floating roller assemblies: all the rollers on this type of support have a concentric sleeve.

The adjustments are made possible by the pivot settings (hub), which comes either with an eccentric or concentric setup.

Custom configuration for roller assemblies are available upon request.

> Rollers adjustments

Adjusting the rollers on a single section rail requires the rollers in a position that allows them to touch the running surface with no play - slightly pre-loaded- A different and more accurate setting is required when the runway is assembled with multiple sections.

The rollers setting must leave $0.15 \div 0.20$ mm backslack (play) from the rail –Use a feeler gauge for best results- The setting requirement is determined by the dimensional tolerances on the rail sections.

> Torque settings

Bolt purpose torque:

M6	(fixing scrapers)	10 Nm
M8	(fixing assemblies)	25 Nm
M10	(fixing assemblies)	45 Nm
M12	(dovetails & fishplates)	55 Nm
M16	(fixing rollers)	75 Nm

Drillings of the end bars:

this are made in order to create a security connection for two or more moving rails that have an end to end joining, through the shaft of the special screws that are used for fixing the fishplate and the dovetails. This additional connection is not a guarantee for the precision but has got the aim to avoid injuries in the case that the moving rails unhook.

> Scrapers

Are manufactured from a sintered compound, self lubricating, having a low friction coefficient. All the roller assemblies come with the scrapers. The purpose of this item is to keep foreign bodies out of the rollers. Scrapers shall never be set to slide on the rail.

They are equipped with mounting and adjustment holes so that a 0.2 mm minimum clearance can be applied.

For application environments with an excessive pollution or dust use the mobile brush assembly.

> Drive head

For Speedy Rail profiles. Machined from a hard polymer rubber molding - Shore A hardness $90 \div 95$ - Normally mounted on the bar ends when the system has a rail that moves in and out the roller assemblies. This rubber end piece allows the rail to be easily guided into the roller assemblies.

> Lubrication

There is no need to lubricate our Speedy Rail profiles. It provides continuous lubrication and keeps the rail clean.

Rollers: standard rollers with regular maintenance/greasing schedule have its own grease nipple. Please use grade 3 grease for working temperature of $10^{\circ}\text{C} \div 60^{\circ}\text{C}$.

Grade 2 grease is required when the working temperature drop below 10°C . Lubricate every 5-6 months.

For the "lifetime" lubrication version, the rollers are supplied with a high tech grease.

The grease nipples are removed from the assemblies since this configuration does not require any periodic lubrication.

> Life testing and speed

Speedy rail and system with plastic shell rollers

The max applicable load, stated in the description of each roller of the Speedy Rail systems, is determined depending on the characteristics of the plastic compound shell. The cylindrical rollers of Speedy Rail system can be used with translation speed up to 15 metres/second and with accelerations and decelerations up to 10 metres/sec². For Speedy Rail and Speedy Rail C 48 systems with "V" shaped and for Speedy Rail 35 plastic compound rollers, the max translation speed is of 8 metres/second while the max accelerations and decelerations are of 8 metres/sec². For higher dynamics please contact our technical department. For all roller types the working temperature limits are -20°C and $+80^{\circ}\text{C}$.

The rollers with plastic compound shell do not damage themselves and do not damage the rails where the invert direction, even in presence of high accelerations and decelerations. Speedy Rail C 48 and Speedy Rail 35 systems has good performance and excellent life even in presence of dust. With stresses on the rollers within the max values stated on the catalogue, the Speedy Rail systems enable a life time of more than 80.000 km for the cylindrical rollers and 50.000 km for the systems with "V" shaped rollers.

The life can be lower due to excessive presence of dust or pollutants.

--	---	---	--	--

Fig. 163

Important: the load on most loaded rollers must be, for each roller type, less or equal to the corresponding rated load on the catalogue.

Trolley on single rail horizontal

Fig. 164

The rollers with concentric sleeve are mounted where there is the highest load and the ones with eccentric sleeve on the opposite end.

All 'F' values must include the dynamic component obtained by:
Inertia force = mass (kg) x acceleration (mt/s^2).

Roller-guide load verification

$$F_{Ass} \Rightarrow \frac{F_y}{4} + \frac{F_y \cdot X + F_x \cdot Y_1}{2 \cdot L} + \frac{F_z \cdot Y + F_y \cdot Z}{2 \cdot d \cdot 1.41}$$

$$F_{Rad} \Rightarrow \frac{F_z}{2} + \frac{F_y}{4} + \frac{F_z \cdot X - F_x \cdot Z_1}{L} + \frac{F_z \cdot Y + F_y \cdot Z}{2 \cdot d \cdot 1.41}$$

Fig. 165

Important: the load on most loaded rollers must be, for each roller type, less or equal to the corresponding rated load on the catalogue.

> Loads on twin 4 'V' rollers trolleys

Trolley on double rail horizontal

(*) Traction force (chain or belt) $T_x = F_x / 2$

Fig. 166

When assembling lines with parallel rail and long strokes it would be wise to use axially-free roller assemblies on one of the rails in order to withstand minor misalignments due either to assembly or maintenance errors.

All 'F' values must include the dynamic component obtained by:
Inertia Force = mass (kg) x acceleration (m/s²).

Roller-guide load verification

$$F_{\text{Rad}} \Rightarrow \frac{F_z}{4} + \frac{F_x \cdot Z + F_z \cdot X}{2 \cdot L}$$

Fig. 167

Important: the load on most loaded rollers must be, for each roller type, less or equal to the corresponding rated load on the catalogue.

> Loads on a 4 'V' rollers vertical trolley

Trolley on single vertical rail

(*) Lifting force (chain or belt) $T_z = F_z$

Fig. 168

The rollers with concentric sleeve are mounted where there is the highest load and the ones with eccentric sleeve on the opposite end.

All 'F' values must include the dynamic component obtained by:

Inertia Force = mass (kg) x acceleration (m/s^2).

Roller-guide load verification

$$F_{\text{Ass}} \Rightarrow \frac{F_y}{4} + \frac{F_y \cdot Z + F_z \cdot Y_1}{2 \cdot L} + \frac{F_y \cdot X - F_x \cdot y}{2 \cdot d \cdot 1.41}$$

$$F_{\text{Rad}} \Rightarrow \frac{F_z \cdot X_1 + F_x \cdot Z}{L} + \frac{F_x \cdot Y - F_y \cdot X}{2 \cdot d \cdot 1.41} + \frac{F_y}{4} + \frac{F_z}{2}$$

Fig. 169

Important: the load on most loaded rollers must be, for each roller type, less or equal to the corresponding rated load on the catalogue.

> Cilindrical roller loads

*1 For sliders with rollers only on one raceway, the M_x moment refers to two sliders mounted on both opposite raceways of the rail.

*2 The M_y moment can only be applied with two sliders mounted on both opposite raceways of the rail.

Therefore, for sliders with rollers only on one raceway, the values in the table refer to two sliders.

*3 For sliders with rollers only on one raceway, the M_z moment refers to two sliders mounted on both opposite raceways of the rail.

*4 Being a single bearing configuration axial load applies if more than one slider is assembled in the rail to avoid bearing movement.

Tab. 28

> User suggestions

When and how to use speedy rail:

When a linear transfer system requires one or more of the following features:

- Lightweight
- Quiet
- Resistant to dust and chemical agents
- Easy to assemble
- Interchangeable

How:

The **Speedy Rail®** beam moves within fixed roller assemblies.

The lightness of the beam offers power and energy cost-savings, increasing the acceleration and speed. Side arm and/or manipulators can be fitted on the moving beam.

The **Speedy Rail®** beam is static and the roller assemblies, connected to a frame, are moving. Either with a static or moving beam, the movement can be realized through several means such as rack-pivot coupling, belts, chain, pneumatic or hydraulic cylinder. For preassembled modular units will you please refer to the catalogue of Rollon modules and portals.

If the value is more than 128 daN, it will be necessary to provide either more supports or only one self-aligning roller assembly with 8 - 10 or 12 rollers, so that the "F" value, divided by the number of rollers on the specified point of application will be equal or less than 128 daN.

Compared to steel beams and roller assemblies, the **Speedy Rail®** surface treatment and plastic compound shells on the rollers allows the utilization of Rollon components in high speed and high accelerations systems. These benefits remove typical damages due to wear normally present in metal to metal sliding situations. When building a system with one single segment of **Speedy Rail®** section, it is possible to slightly pre-load the rollers.

Do not pre-load rollers on a system with a rail composed of 2 or more segments.

Calculations data:

Important calculation factors to consider:

- 1) Maximum beam deflection under the load action
- 2) Maximum roller stress

1) Elastic deflection

Usually in a transfer system the deformations derived from elastic deflection are not a disturbing element.

2) Roller stress

Considering a roller assembly with two cylindric plastic compound rollers, the maximum load on the highest stressed roller should not exceed 128 daN. With the following formula it's possible to calculate the load on the most stressed roller.

$$F = \frac{P \cdot a}{d} + \frac{P}{\sqrt{2}}$$

Power required to drive a trolley or bar

The following calculations are true in a system without overloads generated either by misalignment or an incorrect assembly. The following sliding friction factors are approximate with excess.

Terminology and dimensional units

M [kg]	moving mass
n _r	number of moving rollers
C _r = 100 Nmm	internal max resisting torque for each roller
a [m/s ²]	moving mass acceleration
g [m/s ²]	gravity acceleration
f _{cc} = 0.05	drive resisting coefficient of plastic compound rollers
f _{vc} = 0.065	drive resisting coefficient of 'V' shaped plastic compound rollers
F [N]	drive resisting force
V [m/s]	max traverse speed
N [W]	power
d [mm]	average roller diameter

Calculations

traverse

resisting force	$F = M a + M g f + \frac{2 n_r C_r}{d}$	max power	$N = F V$
-----------------	---	-----------	-----------

Fig. 178

vertical lift

resisting force	$F = M a + M g (1 + f) + \frac{2 n_r C_r}{d}$	max power	$N = F V$
-----------------	---	-----------	-----------

Fig. 179

Thermal expansion of profiles, simple and compound

All profiles specifications are located on pages SR-64.

Terminology and dimensional units

$K_1 = 23 \times 10^{-6} \text{ } 1/^{\circ}\text{C}$	light alloy linear thermal expansion coefficient
$D_t \text{ } [^{\circ}\text{C}]$	temperature variation in comparison with the assembling
$A_1 \text{ } [\text{mm}^2]$	light alloy profile section
$L \text{ } [\text{mm}]$	rail length
$D_1 \text{ } [\text{mm}]$	rail length variation

Calculations

light alloy rails

$$D_1 = K_1 \times D_t \times L$$

Applications

Rails for sliding doors

Glass sheet manipulator

Automatic press feeder

Automated oven feeder - tile production

MiniRoller Rail

NEW

MiniRoller Rail

An alternative to miniature ball guide in several industries and applications:
7 main advantages.

1

Space saving

Thin slider and rail make MiniRoller a very compact solution.
Height: 13mm, Width: 35mm

2

Long lifetime

Induction hardened raceways between 58 and 62 HRC.

3

Resistant to corrosion

Wide range of anticorrosion surface treatments

Easy installation

Eliminates the noise and difficult assembly associated with using mini ball guides.

7

Easy mounting

Compensation of parallelism deviation up to 0.03 mm.

6

Optimal reliability in dirty environments

Ideal for harsh environments as their large rolling components make them highly resistant to dust and dirt contamination.

5

Uniquely quiet

Honed raceways and roller bearings for smooth and silent motion.

4

Easy preload adjustment

Adjustable rollers preload to customize rolling force and motion characteristics.

Product explanation

> Compact linear guide with rollers, induction hardened and honed raceways

Fig. 1

MiniRoller Rail is a steel linear guide with compact design. It has radial roller bearings that glides on an induction hardened and honed raceway. It has been developed for applications that move moderate loads within tight spaces. MiniRoller Rail also manages parallelism deviation up to 0.03 mm.

The most important characteristics:

- Compact size
- Corrosion resistant surface
- Smooth motion
- Hardened and honed raceways surface
- Sliders with four rollers arranged in pairs
- Not sensitive to dirt due to the large rollers
- Low maintenance
- Quieter than recirculating ball systems
- MiniRoller Rail profile rails can be drop-in replace linear guides from another manufacturers while maintaining the same critical dimensions.

Preferred areas of application:

- Building and furniture
- Light handling machines, pick & place
- Special vehicles
- Diagnostic lab and liquid handling
- Pharmaceutical
- Food and beverage
- Interior design with special solutions
- Medical device manufacturing
- Vending & Kiosk machines

Rail:

Rails are made of cold-drawn carbon steel with electrolytic zinc-plated and passivated surface treatment as a standard corrosion protection. Other treatments are available for higher corrosion resistance, these include: zinc nickel and nickel plating. The raceways are induction hardened and honed for smoothness and maximizing the service life.

Fig. 2

Sliders:

The slider body is made of steel DIN 95MnPb28 with electrolytic zinc-plated and passivated surface treatment. Stainless-steel version is available upon request. Rollers are paired with concentric and eccentric types, which enables firm contact with raceway for smooth operation.

Fig. 3

Rollers:

Concentric and eccentric rollers come with radial ball bearings made of steel or stainless steel as two different options. Roller bearing sealing options also come with two different materials: 2RS rubber seals or 2Z steel shields. All roller bearings are lubricated for life.

Fig. 4

Technical data

Fig. 5

Performance characteristics:

- MiniRoller Rail available size: 11
- Max. slider operating speed on the rail: 3 m/s (118 in/s) (depending on application)
- Max. acceleration: 5 m/s² (196 in/s²) (depending on application)
- Available rail lengths up to 1950 mm (78.74 in)
- Temperature range: -20 °C to +120 °C (-4 °F to +248 °F) briefly up to max. +150 °C (+302 °F)
- Rail material: standard C43
- Rail raceways are induction hardened and honed
- Rails and slider bodies are standard electrolytic zinc-plated and passivated; increased anticorrosive protection on request (see pg. MRR-9 Anticorrosive protection)
- Slider body material: steel DIN 9SMnPb28, AISI 304 for the stainless-steel version
- Rollers material: standard steel 100Cr6, AISI 440C stainless steel version.
- Rollers are lubricated for life
- Roller seal/shield: standard 2Z (steel cover disk), 2RS (splash-proof)
- Maximum parallelism deviation: 0.03 mm

Remarks:

- With a simple adjustment of the eccentric roller (denoted with a marking on the bottom of the roller), the slider preload can be set to a desired preload or clearance.
- Factory preload setting also available
- Various surface treatments available upon request

Tab. 6

Technical Instructions

> Lubrication

Roller lubrication

All roller bearings of the MiniRoller rail are lubricated for life.

Lubrication of the raceways

Rails must be lubricated before operation. Recommended lubrication intervals are heavily dependent upon the ambient conditions, speed, and temperature. Under normal conditions, lubrication is recommended after 100 km operational performance or after an operating period of six months whichever comes first. In critical application cases the interval should be shorter. Please clean the raceways carefully before lubrication. We recommend a high quality roller bearing grease lubricant consisting of mineral oil with a white lithium soap base of NLGI 2 grade.

Proper lubrication during normal conditions:

- reduces friction
- reduces wear
- reduces running noise

Different lubricants are available by request for special applications:

- FDA-approved lubricant for use in the food industry
- specific lubricant for clean rooms
- specific lubricant for the marine technology sector
- specific lubricant for high and low temperatures

For specific information, contact Rollon technical support.

> Corrosion protection

The MiniRoller rails and slider bodies come standard with electrolytic zinc plating with passivation for anticorrosion protection. If increased corrosion protection is required, application-specific surface treatments are available upon request for rails e.g. approved nickel plating for use in the

food industry. In this case, the chosen treatment must be specified in the order rails using the appropriate code shown in the table below. For more information contact Rollon technical support.

Treatment	Characteristics
Electrolytic zinc plating with passivation	The treatment is commonly used in sectors where a major corrosion resistance is required. The layer of the treatment is removed, and the raceways are protected with post-honing oil.
ZincNickel ISO19598 (Z)	Ideal for outdoor applications. Stainless steel sliders are ideal combined with zinc nickel rails.
Nickel Plating (N)	Provides high resistance to chemical corrosion and is ideal for applications in medical or food related environments. The raceways come with Nickel plating treatment. Stainless steel sliders are ideal combined with nickel plated rails.

Tab. 7

> Preload

Preload classes

The factory installed systems, consisting of rails and sliders, are available in two preload classes:

Standard preload K1 means a rail-slider combination with minimum preload which means the rollers are adjusted free of clearance for optimal running properties.

Usually preload K2 is used for rail-slider systems for increasing the rigidity. When using a system with K2 preload a reduction of the loading capacities and service life must be taken into consideration (see tab. 8).

Preload class	Reduction y
K1	-
K2	0.1

Tab. 8

This coefficient y is used in the calculation formula for checking the static load and lifetime (see pg. MRR-14, fig. 16). The interference is the difference between the contact lines of the rollers and the raceways of the rail.

Rail size	Preload class	Interference* [mm]
11	K1	0.01
	K2	0.03

* Measured on the largest outer dimension between the raceways

Tab. 9

> Setting the preload

Fig. 12

If the MiniRoller rails are delivered as a system, the sliders are already set with no clearance. In this case the fixing screws are secured with thread locking glue at the factory.

If delivered separately, or if the sliders should be installed in another track, the eccentric roller pins must be readjusted. Important: The fixing screws must be additionally glued against loosening. The following points must also be observed:

- Use thread locking glue for fixing screws against coming loose.
- Wipe the raceways of any dirt and debris.
- Slightly loosen the fixing screws of the roller mounting. The eccentric roller pins are marked on the bottom.
- Position the slider(s) at the ends of the rail.
- The special flat key provided is inserted from the side onto the hexagon of the roller to be set (see fig. 12).

MRR-10

Type	Tightening torque [Nm]
ZK-RMR...	3

Tab. 10

- By turning the flat key clockwise the roller is pressed against the raceway and thus reduces the clearance. Observe that with increasing preload, the friction is also increased and thus the service life reduced.
- Hold the roller pin with the adjustment key in the desired position and carefully tighten the fixing screw.
- Move the slider on the rail and check the preload over the entire length of the rail. It should move easily and the slider should not have play at any location of the rail.
- Now tighten the fixing screws with the specified tightening torque (see tab. 10), while the flat key holds the angle adjustment of the pin. A special thread in the roller pin secures the set position.

> Speed and acceleration

The MiniRoller rail is suitable for low-to-moderate operating speeds and accelerations.

Size	Speed [m/s]	Acceleration [m/s ²]
11	3	5

Tab. 11

> Operating temperatures

The temperature range for continuous operation is: -20 °C / +120 °C with occasional peaks up to +150 °C.

Installation instructions

✓

> Installation of two rails in parallel

If two MiniRoller rails are installed, the height difference of the two rails must not exceed a certain value (obtainable from the table below) in order to ensure proper guiding. These maximum values result from the maximum allowable twisting angle of the rollers in the raceways (see tab. 12).

Size	α
11	1 mrad (0.057°)

Tab. 12

Example:
if $a = 500\text{ mm}$; $b = a \cdot \tan \alpha = 0.5\text{ mm}$

When using two rails, the maximum parallelism deviation must not be exceeded (see tab. 13). Otherwise stresses can occur, which can result in a reduction in load capacity and service life.

Size	K1	K2
11	0.03	0.02

Calculation formulas

✓

> Static load

The radial load capacity rating, C_{Orad} , the axial load capacity rating C_{Oax} , and moments M_x , M_y , M_z indicate the maximum permissible values of the load (see pg. MRR-5), higher loads will have a detrimental effect on the running quality. A safety factor, S_0 , is used to check the static load, which takes into account the basic parameters of the application and is defined more in detail in the following table:

Safety factor S_0	
No shock nor vibration, smooth and low-frequency reverse, high assembly accuracy, no elastic deformations	1.0 - 1.5
Normal installation conditions	1.5 - 2.0
Shock and vibration, high-frequency reverse, significant elastic deformation	2.0 - 3.5

Tab. 14

The ratio of the actual load to maximum permissible load may be as large as the reciprocal of the accepted safety factor, S_0 , at the most.

$$\frac{P_{Orad}}{C_{Orad}} \leq \frac{1}{S_0}$$

$$\frac{P_{Oax}}{C_{Oax}} \leq \frac{1}{S_0}$$

$$\frac{M_1}{M_x} \leq \frac{1}{S_0}$$

$$\frac{M_2}{M_y} \leq \frac{1}{S_0}$$

$$\frac{M_3}{M_z} \leq \frac{1}{S_0}$$

Fig. 15

The above formulas are valid for a single load case.
If two or more forces are acting simultaneously, please check the following formula:

$$\frac{P_{Orad}}{C_{Orad}} + \frac{P_{Oax}}{C_{Oax}} + \frac{M_1}{M_x} + \frac{M_2}{M_y} + \frac{M_3}{M_z} + y \leq \frac{1}{S_0}$$

P_{Orad} = effective radial load (N)
 C_{Orad} = permissible radial load (N)
 P_{Oax} = effective axial load (N)
 C_{Oax} = permissible axial load (N)
 M_1, M_2, M_3 = external moments (Nm)
 M_x, M_y, M_z = maximum permissible moments in the different loading directions (Nm)
 y = reduction due to preload (see pg. MRR-10, Tab. 8)

Fig. 16

The safety factor S_0 can lie on the lower given limit if the occurring forces can be determined with sufficient precision. If shock and vibration are present, the higher value should be selected. For dynamic applications higher safety is required. Please contact Rollon technical support.

> Slider load

Examples of formulas for determining the forces on the most heavily loaded slider

For an explanation of the parameters in the formulas see pg. MRR-17, fig.28.

Fig. 17

Slider load:

$$P_1 = F \cdot \frac{b}{a+b}$$

$$P_2 = F - P_1$$

in addition each slider is loaded by a moment:

$$M_1 = \frac{F}{2} \cdot c$$

Fig. 20

Fig. 18

Slider load:

$$P_{1a} \cong P_{2a} = \frac{F}{2}$$

$$P_{2b} \cong P_{1b} = F \cdot \frac{a}{b}$$

Fig. 21

Fig. 19

Slider load:

$$P_2 = F \cdot \frac{a}{b}$$

$$P_1 = P_2 + F$$

Fig. 22

Note: Applies only if the distance between centers of the sliders $b > 2x$ slider length

Fig. 23

Note: It is defined that slider no. 4 is always located closest to the point where the force is applied.

Slider load:

$$P_1 = \frac{F}{4} - \left(\frac{F}{2} \cdot \frac{b}{c} \right) - \left(\frac{F}{2} \cdot \frac{a}{d} \right)$$

$$P_2 = \frac{F}{4} - \left(\frac{F}{2} \cdot \frac{b}{c} \right) + \left(\frac{F}{2} \cdot \frac{a}{d} \right)$$

$$P_3 = \frac{F}{4} + \left(\frac{F}{2} \cdot \frac{b}{c} \right) - \left(\frac{F}{2} \cdot \frac{a}{d} \right)$$

$$P_4 = \frac{F}{4} + \left(\frac{F}{2} \cdot \frac{b}{c} \right) + \left(\frac{F}{2} \cdot \frac{a}{d} \right)$$

Fig. 25

Fig. 24

Slider load:

$$P_1 \cong P_2 = F \cdot \frac{a}{b}$$

Fig. 26

Note: Applies only if the distance between centers of the sliders $b > 2 \times$ slider length

Fig. 27

Horizontal movement

Test with a moving element of the weight-force F_g at the instant the direction of movement changes

Inertial force

$$F = m \cdot a$$

Slider load at time of reverse

$$P_1 = \frac{F \cdot l}{d} + \frac{F_g}{2} \quad P_2 = \frac{F_g}{2} - \frac{F \cdot l}{d}$$

Fig. 28

Explanation of the calculation formula

F	= effective force (N)
F_g	= weight-force (N)
P_1, P_2, P_3, P_4	= effective load on the slider (N)
M_1, M_2	= effective moment (Nm)
m	= mass (kg)
a	= acceleration (m/s ²)

Fig. 29

> Service life

The dynamic load capacity C is a conventional variable used for calculating the service life. This load corresponds to a nominal service life of 100 km. The following formula (see fig. 30) links the calculated theoretical service life to the dynamic load capacity and the equivalent load:

$$L_{km} = 100 \cdot \left(\frac{C}{P} \cdot \frac{f_c}{f_i} \cdot f_h \right)^3$$

L_{km} = theoretical service life (km)
 C = dynamic load capacity (N)
 P = effective equivalent load (N)
 f_c = contact factor
 f_i = application coefficient
 f_h = stroke factor

Fig. 30

The equivalent load P corresponds in its effects to the sum of the forces and moments working simultaneously on a slider. If these different load components are known, P results as follows:

$$P = P_r + \left(\frac{P_a}{C_{0ax}} + \frac{M_1}{M_x} + \frac{M_2}{M_y} + \frac{M_3}{M_z} + y \right) \cdot C_{0rad}$$

y = reduction due to preload
 (see pg. MRR-10, Tab. 8)

Fig. 31

Here the external loads are assumed as constant in time. Brief loads, which do not exceed the maximum load capacities, do not have any relevant effect on the service life and can therefore be neglected.

The contact factor f_c refers to applications in which several sliders pass the same rail section. If two or more sliders move over the same point of a rail, the contact factor according to table 15 to be taken into account in the formula for calculation of the service life.

Number of sliders	1	2	3	4
f_c	1	0.8	0.7	0.63

Tab. 15

Calculation formulas

The application coefficient f_i takes into account the operational conditions in the service life calculation. It has a similar significance to the safety factor S_0 in the static load test. It is calculated as described in the following table:

f_i	
Neither shocks nor vibrations, smooth and low-frequency direction change; clean operating conditions; low speeds (<1 m/s)	1.0 - 1.5
Slight vibrations, average speeds (1 - 2.5 m/s) and average frequency of direction change	1.5 - 2.0
Shocks and vibrations, high speeds (> 2.5 m/s) and high-frequency direction change; extreme dirt contamination	2.0 - 3.5

Tab. 16

The stroke factor f_h takes into account the higher load of the raceways and rollers during short strokes on the same total length of run. The corresponding values are taken from the following graph (for strokes longer than 1 m, $f_h = 1$):

Fig. 32

ROLLON®
BY TIMKEN

Mono Rail

Product explanation

> Mono Rails are profile rails for the highest degree of precision

Fig. 1

The running grooves are ground in semicircular profile and have a contact angle of 45° in X-arrangement so that the same load capacity is guaranteed in all principle directions. Use of large steel balls enables high load and moment capacities. All carriages in size 55 are equipped with ball chains.

The most important characteristics:

- X-arrangement with 2-point contact of the raceways
- Uniform loading capacity in all main directions
- High ability for self-regulating
- Small differential slip in comparison to 4-point contact
- Very quiet running and low operating noise
- Low maintenance due to advanced lubrication chamber
- Small displacement force in preload compared to 4-point contact
- Mono Rail profile rails meet the market standard and can replace linear rails of the same design from other manufacturers while maintaining the main dimensions
- Miniature Mono Rail available in a standard or large version
- Miniature Mono Rail available in Martensite stainless steel.

Preferred areas of application:

- Construction and machine technology (safety doors, feeding)
- Packaging machines
- Special purpose machinery
- Logistics (e.g., handling units)
- Medical technology (e.g., X-ray equipment, hospital gurneys)
- Semiconductors and electronics industry

MRS

Standard carriage with flange.

Fig. 2

Carriage without flange, also called block. Available in two different heights. MRT is the lower version.

Fig. 3

MRS...L

Carriage in long version for holding larger loads. MRS...L is the version with flange.

Fig. 4

MRS...LW

Carriage in long version without flange.

Fig. 5

MRT...SW

Carriage without flange in short version for lower loads with equally high precision.

Fig. 6

MRR...F

Guide rail MRR...F for bolting from below with threaded holes. Design with smooth surface without bevels.

Fig. 7

Standard width

Compact technology and high performance in its smallest structural shape.

Fig. 8

Large width

Wide miniature profile rails, with a compact size, allow the acceptance of higher forces and moments. Especially suited for single rail applications.

Fig. 9

Technical data

Fig. 10

Performance characteristics:

- Mono Rail available sizes: 15, 20, 25, 30, 35, 45, 55
- Standard version Miniature Mono Rail available sizes: 7, 9, 12, 15
- Large version Miniature Mono Rail available sizes: 9, 12, 15
- Max. operating speed: 3.5 m/s (137.79 in/s)
(depending on application)
- Max. operating temperature: +80 °C (+176 °F)
(depending on application)
- Available rail lengths up to approx. 4,000 mm (157.5 in)
for Mono Rail (see Ordering key, pag. MR-45)
- Four preload classes for Mono Rail: G1, K0, K1, K2
- Three precision classes: N, H, P
- Three preload classes for the Miniature Mono Rails: V0, VS, V1
- Lengths for single rails are available up to 1,000mm (39.37 in) for the Miniature Mono Rail

Remarks:

- Combining rails is possible (joining)
- The fixing holes on the carriages with flange can also be used as through holes for fastening from below. Here, the reduction in size of the screw diameter must be observed
- Various surface coatings on request
- Manual and pneumatic clamping elements available as accessories. Depending on the height of the carriage, additional adapter plates must be used
- Dimensions H_2 and L of the carriage change when using metal deflectioners and other seals. Refer to Sec. 4 Accessories, pg. MR-15f
- The carriages in size 55 are equipped with ball chains
- Primary lubricated systems have an increased displacement resistance

Tab. 14

Accessories

> Safety equipment and covers

End seal

Carriages of Mono Rail profile rails are equipped with end seals for contamination protection as standard.

Fig. 20

Side seal

Carriages are equipped with side seals to prevent permeation of contaminants.

No side seals are available for carriages in long or short version (...SW/...L/...LW).

Fig. 21

Double seal

To improve the protection from contamination at higher loads the carriage can be provided with double end seals.

Fig. 22

Metal deflector (non-contacting)

Metal cuttings or coarse contamination can damage the end seals of the carriage. Metal deflector covers protect seal lips against damage.

Fig. 23

Seal variants:

A: Carriage with end and side seal

C: Carriage with end and side seals and metal deflector

D: Carriage with double end seal and side seal

E: Carriage with double end seal and side seal and metal deflector

Length of carriages change when using the corresponding seal variants

Fig. 24

> Flush cap

Metal debris and other foreign substance can collect in the fixing holes of the rails and thus end up the carriage.

To prevent penetration of contamination in the carriage, the fixing holes should be capped with perforated caps flush with the rail surface.

Flush caps are made of wear and oil resistant synthetic resin. Various sizes of perforated caps for the counter sunk holes for hexagon socket bolts M3 to M22 are included as standard in the scope of supply.

Flush caps are driven in flush with the rail surface with light hammer taps using a flat piece of metal (see fig. 25).

Fig. 25

> Clamping elements

Mono Rail profile rails can be secured with manual or pneumatic clamping elements. Areas of application are:

- Table cross beams and sliding beds
- Width adjustment, stops
- Positioning of optical equipment and measuring tables

Manual clamp elements HK

The HK series is a manually activated clamping element.

Contact profiles press synchronously on the free surfaces of the profile rail by using the freely adjustable clamping lever.

The floating mounted contact profiles guarantee symmetrical introduction of force on the guide rail.

Special characteristics of the clamping elements HK:

- Simple and safe design
- Floating contact profile
- Precise positioning
- Holding force up to 2,000 N

Variants:

An additional adapter plate must be used depending on the height of the carriage (see pg. MR-20, tab. 19).

Activation:

Standard with hand lever, further activation options, e.g. using DIN 912 screw, possible on request.

Pneumatic clamp elements MK / MKS

The patented wedge slide gear puts into effect high holding forces. The pressurised medium moves the wedge slide gear in the longitudinal direction.

Contact profiles press with high force on the free surfaces of the profile rail by the resulting cross movement. MK is an element that closes with pneumatic pressure. The custom design MKS closes with spring energy storage and is opened via air impingement.

Special characteristics of clamp elements MK / MKS:

- Short shape
- High clamp forces
- Precise positioning
- High axial and horizontal rigidity

Areas of application of MK:

- Positioning axes
- Setting vertical axes
- Positioning lifting gear
- Clamping machine tables

Variants:

An additional adapter plate must be used depending on the height of the carriage (see pg. MR-20, tab. 20).

Connection options:

The basic MK / MKS series versions are equipped with air connections on both sides, i.e. the factory default settings air connections and the ventilation filter can be exchanged to the opposite side surfaces.

Custom design MKS opens with impingement of an air pressure of > 5.5 bar.

Areas of application of MKS:

- Clamping with drop in pressure (Normally Open)
- Clamping without power required (Normally Closed)

> Manual clamp HK

* Changed dimensions when using the adapter plate, see pg. MR-20, tab. 19

Fig. 29

> **Miniature Mono Rail precision**

There are three precision classes to choose from for the Mono Rail Miniature profile rails: Classes P, H, and N are manufactured.

Fig. 30

	Precision classes	Precision P [μm]	High H [μm]	Normal N [μm]
H	Tolerance of height H	± 10	± 20	± 40
ΔH	Permissible height difference of different carriages at the same position on the rail	7	15	25
W ₂	Tolerance of width W ₂	± 15	± 25	± 40
ΔW ₂	Permissible width difference of different carriages at the same position on the rail	10	20	30

Tab. 22

Running accuracy

Fig. 31

> Mono Rail Radial clearance / preload

Radial clearance describes the value for the radial movement of the carriage at a constant vertical load, while the carriage moves in longitudinal direction.

Fig. 32

Preload is defined as an effective load on the rolling element in the interior of the carriage in order to remove an existing clearance or to increase the rigidity.

The Mono Rail profile rails are available in the four different preload classes G1, K0, K1 and K2 (see tab. 23). The preload influences the rigidity, precision and torque resistance and also affects the service life and displacement force.

The radial clearance for the respective preload classes are listed in table 24.

Degree of preload	Preload class	Preload
With clearance	G1	0
No clearance	K0	0
Small preload	K1	0,02 x C*
Average preload	K2	0,05 x C*

* C is the dynamic load capacity, see pg. MR-6, Tab. 1.

Tab. 23

Size	Radial clearance of the preload classes [μm]			
	G1 Impact free movement, compensation of assembly tolerances	K0 Impact free and easy movement	K1 Small moments, one rail application, low vibrations	K2 Average vibrations and moments, light impacts
15	+4 to +14	-4 to +4	-12 to -4	-20 to -12
20	+5 to +15	-5 to +5	-14 to -5	-23 to -14
25	+6 to +16	-6 to +6	-16 to -6	-26 to -16
30	+7 to +17	-7 to +7	-19 to -7	-31 to -19
35	+8 to +18	-8 to +8	-22 to -8	-35 to -22
45	+10 to +20	-10 to +10	-25 to -10	-40 to -25
55	+12 to +22	-12 to +12	-29 to -12	-46 to -29

Tab. 24

> **Miniature Mono Rail Preload**

The Mono Rail Miniature profile rails are available in the three different preload classes V_0 , V_s and V_1 (see table 25). The preload influences the rigidity, precision and torque resistance and also affects the product service life and displacement force.

Type	Preload classes		
	Small clearance Very quiet running V_0 [μm]	Standard Very quiet and precise running V_s [μm]	Small preload High rigidity, vibration reduced, high precision, good load balance V_1 [μm]
MR07	from +5 to +2	from +1 to -2	from -2 to -4
MR09	from +5 to +2	from +2 to -2	from -2 to -5
MR12	from +6 to +2	from +2 to -2	from -2 to -5
MR15	from +7 to +2	from +2 to -3	from -2 to -6

Tab. 25

> Anticorrosive protection

There are numerous application-specific surface treatments available for profile rails of the Mono Rail product family.

> Mono Rail lubrication

Profile rails must generally be lubricated before commissioning. They can be lubricated with oil or grease.

The correct lubricant selection has a large influence on the service life and the function of the profile rail, insufficient lubrication and tribocorrosion can ultimately lead to total failure.

Important instructions for lubrication

- Mono Rail profile rails must be lubricated for operation.
- The carriage must be moved back and forth during lubrication.
- The lubricant is inserted through a lubrication nipple.
- There should be a thin film of lubricant on the rail surface at all times.
- Please inform us in advance if the guides are to be used in acid or base containing environments or in clean rooms.

Grease lubrication

We recommend the use of a lithium emulsified lubricant NLGI Class 2 for lubrication.

Relubrication

- Relubrication of the system must be done before the lubricant used is dirty or shows discolouration.
- Relubrication is performed at operating temperature. The carriage must be moved back and forth during relubrication.
- If the stroke is <2 or >15 times the carriage length, the lubrication intervals should be more often.

Lubrication condition on delivery

Single parts (separate sliders and rails) are provided with an anticorrosion oil and they have to be lubricated first thing after assembly. Assemblies are provided with lubrication grease applied.

Initial lubrication and relubrication

Self-lubricating

The carriages of the following sizes have a self-lubrication element to extend lubrication intervals.

Size	Initial lubrication grease [cm³]	Relubrication [cm³]	Initial lubrication oil [cm³]
15	1.3	1.1	1.5
20	2.3	2	2.5
25	2.8	2.5	3.5
30	3.5	3	4.5
55	5.5	4	5.5

The given lubrication quantities apply to preload K1 and speeds ≤ 1 m/s

Tab. 26

For more information please contact Rollon technical support. All linear rails of the Miniature Mono Rail series are made of stainless steel.

As well as reducing friction and wear, lubricants also serve as sealant, noise damper and corrosion protection for the linear guide. Different lubricants for special applications are available upon request.

For more information please contact Rollon technical support.

- Primary lubricated systems have an increased displacement resistance.
- Please contact Rollon technical support if the rail will be oriented vertically.
- If the stroke is <2 or >15 times the carriage length, the lubrication intervals should be shortened.

Oil lubrication

We recommend a synthetic oil for operating temperatures between 0 °C and +70 °C. For application-specific custom lubrication, please contact Rollon technical support.

Lubrication intervals

Operating speed, stroke length and ambient conditions influence the selection of time between lubrication intervals. Establishing a safe lubrication interval is based exclusively on the experienced practiced values determined on site. However, in any case a lubrication interval should not be longer than one year or 100 km of use, depending on the value reached first.

Not self-lubricating

The carriages of sizes 35 and 45 are not self-lubricating due to the design.

Size	Initial lubrication grease [cm³]	Relubrication [cm³]	Initial lubrication oil [cm³]
35	3.5	3	3.5
45	4.5	3.5	4.5

The given lubrication quantities apply to preload K1 and speeds ≤ 1 m/s

Tab. 27

> Miniature Mono Rail lubrication

Function

The contact points between ball and track are separated from each other by a microscopically thin oil film. The lubrication effects:

- Reduction of friction
- Reduction of wear
- Corrosion protection
- Better thermal distribution and therefore increased of service life

Fig. 33

Important instructions for lubrication

- Mono Rail Miniature profile rails must be lubricated for operation.
- The carriage must be moved back and forth during lubrication.
- The lubricant can also be applied to the tracks.
- The lubricant can be injected into the lubrication holes on both sides of the carriage.
- There should be a thin film of lubricant on the rail surface at all times.
- Please inform us in advance if the guides are to be used in acid or base containing environments or in clean rooms.
- Please contact the sales department if the oil lubrication should be used for vertical use of the guide.
- If the stroke is < 2 or > 15 times the carriage length, the lubrication intervals should be more often.

Type	First lubrication [cm ³]
MR07MN	0.12
MR09MN	0.23
MR12MN	0.41
MR15MN	0.78

Tab. 28

Type	First lubrication [cm ³]
MR09WN	0.30
MR12WN	0.52
MR15WN	0.87

Tab. 29

Grease lubrication

When using grease lubrication, we recommend synthetic-oil based lithium grease with a viscosity according to ISO VG 32 to ISO VG 100.

Oil lubrication

We recommend CLP or CGLP synthetic oil conforming to DIN 51517 or HLP to DIN 51524 and a viscosity range conforming to ISO VG 32 to ISO VG 100 for operating temperatures between 0 °C and +70 °C. We recommend a viscosity according to ISO VG 10 for use at low temperatures. For application-specific special lubrication please contact Rollon technical support.

ISO VG 10	≙	Viscosity of 10 $\frac{\text{mm}^2}{\text{s}}$	at 40 °C
ISO VG 32	≙	Viscosity of 32 $\frac{\text{mm}^2}{\text{s}}$	at 40 °C
ISO VG 100	≙	Viscosity of 100 $\frac{\text{mm}^2}{\text{s}}$	at 40 °C

Fig. 34

Lubrication intervals

Operating speed, stroke length and ambient conditions influence the selection of time between lubrication intervals. Establishing a safe lubrication interval is based exclusively on the experienced practiced values determined on site. However, in any case a lubrication interval should not be longer than one year or 100 km of use, depending on the value reached first.

Relubrication

- Relubrication of the system must be done before the lubricant used is dirty or shows discolouration.
- Relubrication is performed at operating temperature.
During relubrication, the carriage should be moved back and forth.
- If the stroke is < 2 or > 15 times the carriage length, the lubrication intervals should be more often.

Lubrication condition on delivery

Single parts (separate sliders and rails) are provided with an anticorrosion oil and they have to be lubricated first thing after assembly. Assemblies are provided with lubrication oil applied.

> Mono Rail lubrication nipple

The following lubrication nipples are part of the standard delivery:

Fig. 35

Lubrication nipple	Size
NLA01	15
NLB02	20
	25
	30
	35
NLB04	45
	55

Tab. 30

Other lubrication nipples, such as lubrication adapters with hose inlet or with quick-coupling, are available on request. Please observe that the thread lengths (see fig. 35) can be changed when using additional deflec-tors and end seals. For more information please contact Rollon technical support.

> Mono Rail loading

The given static load capacity for each carriage represents the maximum permissible load value, which if exceeded causes permanent deformations of the raceways and adverse effects of the running properties.

Checking the load must be done as follows:

- through determination of the simultaneously occurring forces and moments for each carriage
- by comparison of these values with the corresponding load capacities.

The ratio of the actual load to maximum permissible load may be as large as the reciprocal of the accepted safety factor, S_0 , at the most.

$\frac{P_{Orad}}{C_{Orad}} \leq \frac{1}{S_0}$	$\frac{P_{Oax}}{C_{Oax}} \leq \frac{1}{S_0}$	$\frac{M_1}{M_x} \leq \frac{1}{S_0}$	$\frac{M_2}{M_y} \leq \frac{1}{S_0}$	$\frac{M_3}{M_z} \leq \frac{1}{S_0}$
--	--	--------------------------------------	--------------------------------------	--------------------------------------

Fig. 36

The above formulas are valid for a single load case.

If two or more forces are acting simultaneously, please check the following formula:

$\frac{P_{Orad}}{C_{Orad}} + \frac{P_{Oax}}{C_{Oax}} + \frac{M_1}{M_x} + \frac{M_2}{M_y} + \frac{M_3}{M_z} \leq \frac{1}{S_0}$	<p>P_{Orad} = effective radial load (N)</p> <p>C_{Orad} = permissible radial load (N)</p> <p>P_{Oax} = effective axial load (N)</p> <p>C_{Oax} = permissible axial load (N)</p> <p>M_1, M_2, M_3 = external moments (Nm)</p> <p>M_x, M_y, M_z = maximum permissible moments in the different loading directions (Nm)</p>
--	--

Fig. 37

Safety factor

Operating conditions	S_0
Normal operation	1 ~ 2
Loading with vibration or shock effect	2 ~ 3
Loading with strong vibration or impacts	≥ 3

Tab. 31

The safety factor S_0 can lie on the lower given limit if the occurring forces can be determined with sufficient precision. If shock and vibration are present, the higher value should be selected. For dynamic applications higher safety is required. Please contact Rollon technical support.

> Mono Rail service life

Calculation of service life:

The dynamic load capacity C is a conventional variable used for calculating the service life. This load corresponds to a nominal service life of 50 km. The relationship between calculated service life L_{km} (in km), dynamic load capacity C (in N) and equivalent load P (in N) is given in the formula to the right:

$$L_{km} = \left(\frac{C}{P} \cdot \frac{f_c}{f_i} \right)^3 \cdot 50 \text{ km}$$

f_c = contact factor
 f_i = application coefficient

Fig. 38

The equivalent load P corresponds in its effects to the sum of the forces and moments working simultaneously on a slider. If these different load components are known, P results from the equation to the right:

$$P = |P_{0ax}| + |P_{0rad}| + \left(\frac{|M_1|}{M_x} + \frac{|M_2|}{M_y} + \frac{|M_3|}{M_z} \right) \cdot C_{0rad}$$

Fig. 39

Contact factor f_c

The contact factor f_c refers to applications in which several carriages pass the same rail section. If two or more carriages are moved over the same point on a rail, the static and dynamic loading values must be multiplied with the numbers from the table below:

Number of carriages	1	2	3	4	5
f_c	1	0.81	0.72	0.66	0.61

Tab. 32

Application coefficient f_i

The application coefficient f_i can be understood as the dynamic safety factor. Refer to the table below for the values:

Operational conditions	Speed	f_i
Neither external impacts nor vibrations	Low speed $V \leq 15$ m/min.	1 - 1.5
Light impacts or vibrations	Average speed $15 < V \leq 60$ m/min.	1.5 - 2
Average and high external impacts or vibrations	High speed $V > 60$ m/min.	2 - 3.5

Tab. 33

> Miniature Mono Rail loading

Static load (P_0) and static moment (M_0)

Permissible static load

The permissible static load of the Mono Rail Miniature profile rail is limited by:

- Static load of each linear guide
- Permissible load of the fixing screws
- Permissible load of all components used in the surrounding construction
- Static safety factor, which is required by the corresponding application

The equivalent static load and the static moment are the largest load, or the largest moment, which are calculated based on formulas 3 and 4.

Static safety factor S_0

When observing the static safety factor S_0 the Mono Rail Miniature profile rails allow a permissible operation and high running precision as is required for each application. Calculation of the static safety factor S_0 : see fig. 39

S_0 static safety factor

C_0 static load capacity in loading direction (N)

P_0 equivalent static load (N)

M_0 static moment in loading direction (Nm)

M equivalent static moment in loading direction (Nm)

Static load capacity C_0

The static load capacity C_0 of ball recirculating guides is defined according to DIN 636, Part 2 as the only load which gives a Hertzian stress of 4,200 MPa with the existing lubrication between track and balls in the center of the highest loaded contact surface.

Note: In the loading center, there is a permanent deformation of approx 0.01 % of the ball diameter under this load (according to DIN 636, Part 2).

$S_0 = C_0 / P_0$	Formula 1	Operating conditions	S_0
$S_0 = M_0 / M$	Formula 2	Normal operation	1 ~ 2
$P_0 = F_{\max}$	Formula 3	Loading with vibration or shock effect	2 ~ 3
$M_0 = M_{\max}$	Formula 4	High precision and smooth running	≥ 3

Fig. 40

> **Miniature Mono Rail service life**

An example of a profile rail or a lot of identical profile rails under the same running conditions, which use ordinary materials with normal manufacturer's quality and operating conditions, can reach 90 % of the calculated service life (as per DIN 636 Part 2). By taking 50 km traverse as a basis, the dynamic load capacity is usually 20 % over the values as per DIN. The relationship between the two load capacities can be seen from formulas 5 and 6.

Calculation of service life

Formulas 7 and 8 are used for calculating the service life, if equivalent dynamic load and average speed are constant.

$C_{(50)} = 1,26 \cdot C_{(100)}$	Formula 5	
$C_{(100)} = 0,79 \cdot C_{(50)}$	Formula 6	
$L = \left(\frac{C_{100}}{P}\right)^3 \cdot 10^5$	Formula 7	
$L_h = \frac{L}{2 \cdot s \cdot n \cdot 60} = \frac{L}{V_m} \cdot \left(\frac{C_{100}}{P}\right)^3$	Formula 8	
		<div><div>L = service life based on 100,000 (m)</div><div>L_h = service life (h)</div><div>C = dynamic load capacity (N)</div><div>P = equivalent dynamic load (N)</div><div>S = stroke length (m)</div><div>n = stroke frequency (min⁻¹)</div><div>V_m = average speed (m/min)</div></div>

Fig. 41

Dynamic load capacity C

If the dynamic loads work vertically on the last zones with equal size and direction, the calculated service life of the linear guide can theoretically reach 100 km piston travel (as per DIN 636, Part 2).

Combined loads in combination with moments

If both loads and moments work on the profile rails, the equivalent dynamic load is calculated with formula 13. According to DIN 636, Part 1, the equivalent load should not exceed $\frac{1}{2} C$.

Equivalent dynamic load and speed

With changing load and speed, these must be considered individually since each parameter helps determine the service life.

Equivalent dynamic load

If only the load changes, the equivalent dynamic load can be calculated with formula 9.

Equivalent speed

If only the speed changes, the equivalent speed is calculated with formula 6.

If speed and load change, the equivalent dynamic load is calculated with formula 11.

Combined dynamic load

With combined exterior load in an arbitrary angle, the equivalent dynamic load is calculated with formula 12.

$$P = \sqrt[3]{\frac{q_1 \cdot F_1^3 + q_2 \cdot F_2^3 + \dots + q_n \cdot F_n^3}{100}} \quad \text{Formula 9}$$

$$\bar{v} = \frac{q_1 \cdot v_1 + q_2 \cdot v_2 + \dots + q_n \cdot v_n}{100} \quad \text{Formula 10}$$

$$P = \sqrt[3]{\frac{q_1 \cdot v_1 \cdot F_1^3 + q_2 \cdot v_2 \cdot F_2^3 + \dots + q_n \cdot v_n \cdot F_n^3}{100}} \quad \text{Formula 11}$$

$$P = |F_x| + |F_y| \quad \text{Formula 12}$$

$$P = |F_x| + |F_y| + \left(\frac{|M_1|}{M_x} + \frac{|M_2|}{M_y} + \frac{|M_3|}{M_z} \right) \cdot C_0 \quad \text{Formula 13}$$

P	= equivalent dynamic load (N)
q	= stroke (in %)
F ₁	= individual load levels (N)
v	= average speed (m/min)
\bar{v}	= individual speed levels (m/min)
F	= external dynamic load (N)
F _y	= external dynamic load – vertical (N)
F _x	= external dynamic load – horizontal (N)
C ₀	= static load capacity (N)
M ₁ , M ₂ , M ₃	= external moments (Nm)
M _x , M _y , M _z	= maximum permissible moments in the different loading directions (Nm)

Fig. 42

> Friction / displacement resistance

Mono Rail profile rails have a low friction characteristic and thus low displacement resistance. The low start-up friction (breakaway force) is almost identical to the moving friction (running resistance).

The displacement resistance is dependent upon several factors:

- Friction of the sealing system
- Friction of the balls with each other
- Friction between balls and redirection
- Rolling resistance of the balls in the running grooves
- Resistance of lubricant in the carriage
- Resistance by contamination in the lubricant
- Preload for increase of rigidity
- Moment load

Resistance of the seals

Type	f [N]
MRS15	0.15
MRS20	0.2
MRS25	0.35
MRS30	0.7
MRS35	0.8
MRS45	0.9
MCS55	1.0

Tab. 34

Fig. 43

Displacement resistance

The following formula is used for general approximate calculation of the displacement resistance. Please note that the level of preload or the viscosity of the lubricant used can also influence the displacement resistance.

$F_m = \mu \cdot F + f$	F_m = Displacement resistance (N) F = Load (N) μ = Coefficient of friction f = Resistance of the seals (N)
-------------------------	---

Fig. 44

Mono Rail profile rails have a coefficient of friction of approx.
 $\mu = 0.002 - 0.003$.

> Mono Rail installation instructions

The given radii and shoulder heights in the table must be observed when assembling rails and carriages on the stop edges to ensure perfect seating of carriages or raceways.

Fig. 45

Size	Maximum level of incline	Maximum height of rail shoulder	Maximum height of rail shoulder when using the side seal	Maximum height of slider shoulder	Required bolt lengths (rails)

MR15W	2.5	0.5	4.5	0.5	4

Tab. 39

Geometric and positional accuracy of the mounting surfaces

Inaccuracies of the mounting surface negatively influence the running accuracy and reduce the service life of the Mono Rail Miniature profile rails. If the inaccuracies of the mounting surfaces exceed the values calculated using formulas 14, 15 and 16, the service life is shortened according to formulas 12 and 13.

Mounting surface

The mounting surface should be ground or milled very finely and have a surface roughness of R_a 1.6.

Reference surface

Rail: Both sides of the rails can be used as a reference surface without further marks.

Slider: The reference surface is located across from the running side identified with a notch mark.

Calculation of the positional accuracy

Tab. 42

Composite rails

Guide rails longer than the one part maximum length (see Ordering key), are put together from two or more rails.

When putting guide rails together, be sure that the register marks shown in fig. 51 are positioning correctly.

These are fabricated axisymmetric for parallel application of composite guide rails, unless otherwise specified.

Fig. 51

Assembly process

Fig. 52

Fixing guide rails:

(1) Whet the assembly surface with a whetstone and also remove burrs, unevenness and dirt (see fig. 53).

Note: All linear guides are preserved with anticorrosion oil at the factory. This protection must be removed before installation.

In doing so, please ensure that the surfaces are coated with low-viscosity oil for the purpose of further protection against corrosion.

Fig. 53

(2) Carefully lay the guide rail on the assembly surface (see fig. 54) and slightly tighten the fixing screws so that the guide rail lightly touches the assembly surface (align the guide rail along the shoulder edge of the assembly surface, see fig. 55).

Note: The fixing screws of the linear guide must be clean. Check if the fixing holes are located in the correct place when you insert the bolts. A forced tightening of a fixing screw in an offset hole can negatively affect accuracy.

Fig. 54

Fig. 55

(3) Tighten the thrust bolts on the guide rail until there is close contact on the side stop surface (see fig. 56).

Fig. 56

(4) Tighten the fixing screws with a torque wrench to the prescribed torque (see pg. MR-36, tab. 37).

Note: For a high degree of accuracy, the fixing screws of the guide rail must be tightened in sequence outward from the centre (see fig. 57).

(5) Assemble the other rails in the same manner to complete the installation of the guide rails.

Fig. 57

Table assembly:

(6) Set the table carefully on the carriage and tighten the fixing screws only lightly.

(7) Press the carriage on the main guide side with the thrust bolts against the shoulder edge of the table and position the table.

(8) Tighten the fixing screws on the main side and the lateral side completely tight to finish the installation. Note:

To attach the table uniformly, tighten the fixing screws diagonally (see fig. 58). This method saves time when straightening the guide rail and makes the manufacture of positioning pins unnecessary, which considerably reduces assembly time.

Fig. 58

> Installation examples

The following drawings illustrate some assembly examples for rail/carriage combinations corresponding to the structure of various machine frames:

Example 1:

Assembly of carriage and rail on shoulder edges

Example 2:

Securing carriage and rail using set screws

Example 3:

Securing carriage and rail using set pressure plates

Example 4:

Securing carriage and rail using taper gibs

Example 5:

Securing carriage and rail using bolts

> Rail / Mono Rail slider system

MRS30W	H	K1	A	1	05960	F	T	NIC	
									Surface coating for rail optional <i>see pg. MR-25, Anticorrosive protection</i>
									Joint processed rails optional <i>see pg. MR-39, Composite rails</i>
									Rails bolted from below, optional <i>see pg. MR-11</i>
									Total rail length
									Number of carriages
									Seal variants <i>see pg. MR-15f</i>
									Preload class <i>see pg. MR-23, tab. 23f</i>
									Precision class <i>see pg. MR-21, tab. 21</i>
Type									

Ordering example: MRS30W-H-K1-A-1-05960F-T-NIC

Rail composition: 1x3100+1x2860 (only for joint processed rails)

Hole pattern: 20-38x80-40//40-35x80-20 (please always indicate the hole pattern separately)

Notes on ordering: The rail lengths are always indicated as 5 digits with 0 prefixes

> Rail

MRR	20	6860	N	F	T	NIC	
							Surface coating for rail optional <i>see pg. MR-25, Anticorrosive protection</i>
							Joint processed rails optional <i>see pg. MR-39, Composite rails</i>
							Rails bolted from below, optional <i>see pg. MR-11</i>
							Precision class <i>see pg. MR-21, tab. 21</i>
							Total rail length
Size							
Rail type							

Ordering example: MRR20-06850-NF-T-NIC

Rail composition: 1x2920+1x3940 (only for joint processed rails)

Hole pattern: 10-48x60-30//30-65x60-10 (please always specify the hole pattern separately)

Notes on ordering: The rail lengths are always indicated as 5 digits with 0 prefixes

Ordering example: MRS35-N-K0-A-NIC

Ordering example: MR15MN-SS-2-V1-P-310

Hole pattern: 15-7x40-15, see fig. 61, tab. 44 / fig. 62, tab. 45

> Mono Rail hole pattern

Rail

Fig. 59

Size	Hole pitch P [mm]	L_{2min}, L_{3min} [mm]	L_{2max}^*, L_{3max}^* [mm]	L_{0max} [mm]
15	60	7	20	4000
20				
25				
30	80	8.5	22.5	3960
35				
45	105	11.5	30	3930
55	120	13		3900

* Only applies when using max. rail lengths

Tab. 43

> Miniature Mono Rail hole pattern

Standard width

Fig. 60

Size	L_{min} [mm]	Hole pitch P [mm]	L_2, L_{3min} [mm]	L_2, L_{3max}^* [mm]	L_{max} [mm]
7	40	15	3	10	1000
9	55	20	4	15	
12	70	25	4	20	
15	70	40	4	35	

* does not apply to minimum (L_{min}) and maximum rail length (L_{max})

Tab. 44

Large width

Fig. 61

Size	L_{min} [mm]	Hole pitch P [mm]	L_2, L_{3min} [mm]	L_2, L_{3max}^* [mm]	L_{max} [mm]
9	50	30	4	25	1000
12	70	40	5	35	
15	110	40		35	

* does not apply to minimum (L_{min}) and maximum rail length (L_{max})

TO SUPPORT YOU, WE DESIGN AND PRODUCE

Rollon's goal is to support you become **more competitive in your markets**, through technological solutions, design simplification, productivity, reliability, duration, and low maintenance.

We offer everything from **individual components to specifically designed**, mechanically integrated systems: the quality of our applications is an expression of our technology and competence.

ROLLONLAB: EXPERIMENTATION AND INNOVATION

RollonLab, a specialized laboratory where new products created by the R&D department are tested and optimized to perform beyond their technical limits through performance tests and strict quality controls.

RollonLab also tests products in simulations of different application scenarios, to guarantee that the client receives **highly competitive custom products**.

SUPPORT & CUSTOMIZATION

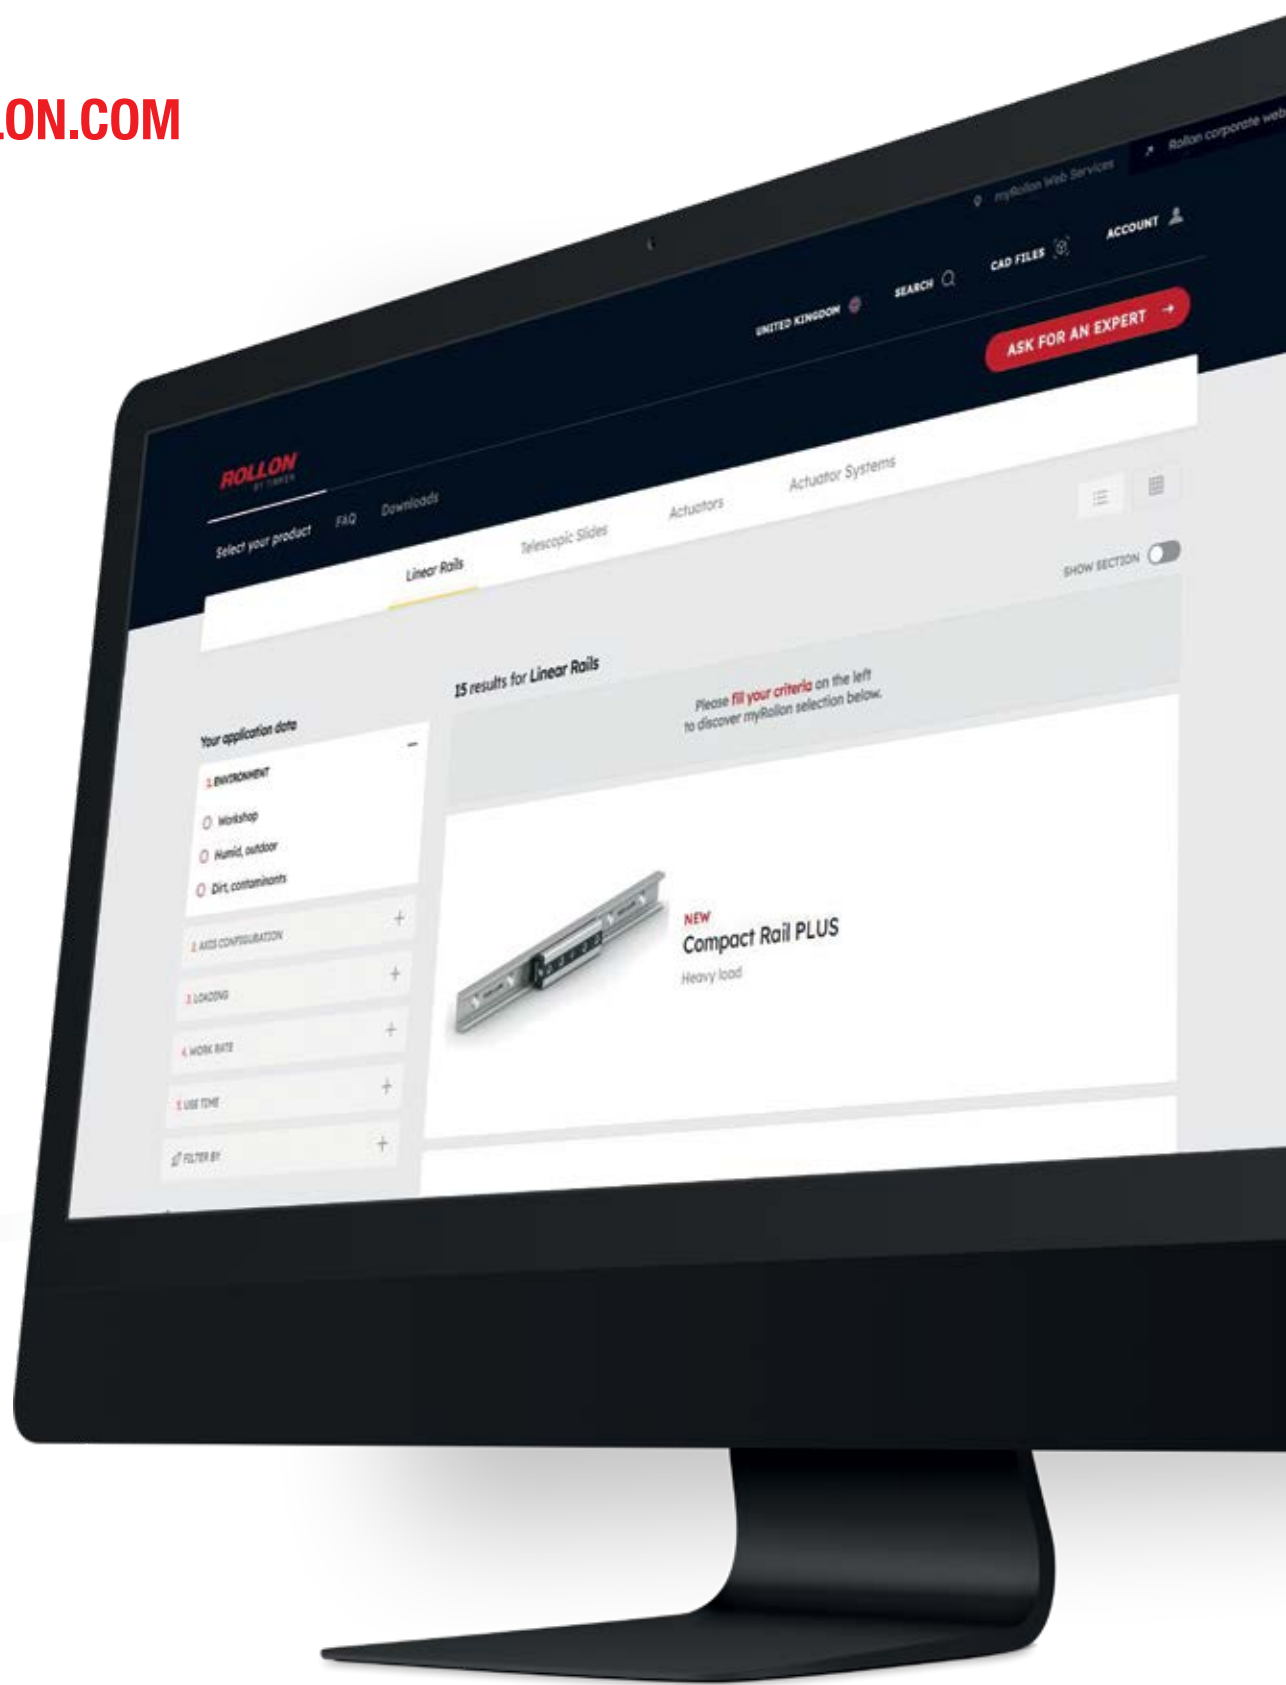

- Product training
- Custom product prototyping
- Application sizing and engineering
- 2D / 3D product drawings on demand
- On-site support for first installation and mock-ups
- Co-design service on sub-systems and full assemblies
- Internal laboratory for static abuse load and endurance tests

Thanks to the experience acquired through years of applications and research, we are able to provide high quality products specifically designed for your needs.

A NEW **DIGITAL EXPERIENCE**
SURROUNDED BY **ROLLON EXPERTS**
WHERE YOU CAN EASILY SELECT
THE PRODUCT **YOU NEED.**
